## 1.8V NAND Flash + 1.8V Mobile DDR SDRAM Multi-Chip Package

### Product Features

- Multi-Chip Package
  - NAND Flash Density: 1-Gbits
  - Mobile DDR SDRAM Density: 512-Mbit
- Device Packaging
  - 130 balls BGA
  - Area: 8 x 9mm; Height: 1mm
- Operating Voltage
  - NAND : 1.7V to 1.95V
  - Mobile DDR SDRAM : 1.7V to 1.95V
- Operating Temperature : -25 °C to +85 °C

### NAND FLASH

- Voltage Supply: 1.8V (1.7V ~ 1.95V )
- Organization
  - Memory Cell Array: (64M + 2M) x 16bit
  - Multiplexed address/ data
  - Data Register: (1K + 32) x 16bit
- Automatic Program and Erase
  - Page Program: (1K + 32) words
  - Block Erase: (64K + 2K) words
- Page Read Operation
  - Page Size: (1K + 32) words
  - Random Read: 25us (Max.)
  - Serial Access: 45ns (Min.)
- Memory Cell: 1bit/Memory Cell
- Fast Write Cycle Time
  - Program time: 250us (Typ.)
  - Block Erase time: 2ms (Typ.)
- Command/Address/Data Multiplexed I/O Port
- Hardware Data Protection
  - Program/Erase Lockout During Power Transitions
- Reliable CMOS Floating Gate Technology
- Endurance:
  - 100K Program/Erase Cycles (with 1 bit/264 words ECC)
  - Data Retention: 10 Years
- Command Register Operation
- Automatic Page 0 Read at Power-Up Option
  - Boot from NAND support
  - Automatic Memory Download
- NOP: 4 cycles
- Cache Program/Read Operation
- Copy-Back Operation
- EDO mode
- OTP Operation

### Mobile DDR SDRAM

- Density: 512M bits
- Organization: 8M words x16 bits x 4 banks
- Power supply:  $V_{DD}/V_{DDQ} = 1.70 \sim 1.95V$
- Speed: 400Mbps (max.) for data rate
- 2KB page size
  - Row address: A0 to A12
  - Column address: A0 to A9
- Four internal banks for concurrent operation
- Interface: LVCMOS
- Burst Lengths: 2, 4, 8 or 16
- Burst type: Sequential or interleave
- CAS# latency (CL) : 3
- Precharge: auto precharge option for each burst access
- Drive Strength: normal, 1/2, 1/4, 1/8
- Refresh: auto Refresh and self-refresh
- Refresh cycles: 8192 cycles/64ms
- Optional Partial Array Self Refresh (PASR)
- Auto Temperature Compensated Self Refresh (ATCSR) by built-in temperature sensor
- Deep Power Down Mode
- Burst termination by burst stop command and precharge command
- DLL is not implemented
- Double-data rate architecture; two data transfer per clock cycle
- The high-speed data transfer is realized by the 2 bits prefetch pipelined architecture
- Bidirectional data strobe (DQS) is transmitted/received with data for capturing data at the receiver
- DQS edge-aligned with data for READs; center-aligned with data for WRITEs
- Differential clock inputs (CK and CK#)
- Commands entered on each positive CK edge; data and data mask referenced to both edges of DQS
- Data mask (DM) for write data

Ordering Information

**Ball Descriptions**

Pin Name	Type	Function
<b>NAND</b>		
VCC	Supply	Supply Voltage
VSS	Supply	Ground
I/O0-I/O15	Input/output	Data input/outputs, address inputs, or command inputs
ALE	Input	Address Latch Enable
CLE	Input	Command Latch Enable
$\overline{\text{CE}}$	Input	Chip Enable
$\overline{\text{RE}}$	Input	Read Enable
$\overline{\text{WE}}$	Input	Write Enable
$\overline{\text{WP}}$	Input	Write Protect
R / $\overline{\text{B}}$	Output	Ready/Busy (open-drain output)
<b>Mobile DDR SDRAM</b>		
VDD	Supply	Power Supply
VSSD	Supply	Ground
VDDQ	Supply	DQ's Power Supply: Isolated on the die for improved noise immunity.
VSSQ	Supply	Ground
CK, CK#	Input	CK and CK# are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK and negative edge of CK#. Input and output data is referenced to the crossing of CK and CK# (both directions of crossing). Internal clock signals are derived from CK, CK#
CKE	Input	CKE HIGH activates, and CKE LOW deactivates internal clock signals, and device input buffers and output drivers. Taking CKE LOW provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all banks idle), or ACTIVE POWERDOWN (row ACTIVE in any bank). CKE is synchronous for all functions except for SELF REFRESH EXIT, which is achieved asynchronously. Input buffers, excluding CK, CK# and CKE, are disabled during power-down and self refresh mode which are contrived for low standby power consumption.
CS#	Input	CS# enables (registered LOW) and disables (registered HIGH) the command decoder. All commands are masked when CS# is registered HIGH. CS# provides for external bank selection on systems with multiple banks. CS# is considered part of the command code.
RAS#, CAS#, WE#	Input	CAS#, RAS#, and WE# (along with CS#) define the command being entered.
A0-A12	Input	Provide the row address for ACTIVE commands, and the column address and AUTO PRECHARGE bit for READ / WRITE commands, to select one location out of the memory array in the respective bank. The address inputs also provide the opcode during a MODE REGISTER SET command.
BA0, BA1	Input	BA0 and BA1 define to which bank an ACTIVE, READ, WRITE or PRECHARGE command is being applied.
DQ0-DQ15	Input / Output	Data Input/Output pins operate in the same manner as on conventional DRAMs.
LDQS, UDQS	Input / Output	Output with read data, input with write data. Edge-aligned with read data, centered with write data. Used to capture write data. LDQS corresponds to the data on DQ0-DQ7, UDQS corresponds to the data on DQ8-DQ15.
LDM, UDM	Input	DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH along with that input data during a WRITE access. DM is sampled on both edges of DQS. Although DM pins are input-only, the DM loading matches the DQ and DQS loading. LDM corresponds to the data on DQ0-DQ7, UDM corresponds to the data on DQ8-DQ15.

## NAND Flash Memory Operations

## GENERAL DESCRIPTION

The NAND Flash is a 64Mx16bit with spare 2Mx16bit capacity. The NAND Flash is offered in 1.8V  $V_{CC}$  Power Supply. Its NAND cell provides the most cost-effective solution for the solid state mass storage market. The memory is divided into blocks that can be erased independently so it is possible to preserve valid data while old data is erased.

The NAND Flash contains 1,024 blocks, composed by 64 pages consisting in two NAND structures of 32 series connected Flash cells. A program operation allows to write the 1,056-word page in typical 250us and an erase operation can be performed in typical 2ms on a 64K-word for device block.

Data in the page mode can be read out at 45ns cycle time per Byte. The I/O pins serve as the ports for address and command

inputs as well as data input/output. The copy back function allows the optimization of defective blocks management: when a page program operation fails the data can be directly programmed in another page inside the same array section without the time consuming serial data insertion phase. The cache program feature allows the data insertion in the cache register while the data register is copied into the Flash array. This pipelined program operation improves the program throughput when long files are written inside the memory. A cache read feature is also implemented. This feature allows to dramatically improving the read throughput when consecutive pages have to be streamed out. This NAND Flash includes extra feature: Automatic Read at Power Up.

## PIN DESCRIPTION

Symbol	Pin Name	Functions
I/O0~ I/O15	Data Inputs / Outputs	The I/O pins are used to input command, address and data, and to output data during read operations. The I/O pins float to Hi-Z when the chip is deselected or when the outputs are disabled.
CLE	Command Latch Enable	The CLE input controls the activating path for commands sent to the command register. When active high, commands are latched into the command register through the I/O ports on the rising edge of the $\overline{WE}$ signal.
ALE	Address Latch Enable	The ALE input controls the activating path for address to the internal address registers. Addresses are latched on the rising edge of $\overline{WE}$ with ALE high.
$\overline{CE}$	Chip Enable	The $\overline{CE}$ input is the device selection control. When the device is in the Busy state, $\overline{CE}$ high is ignored, and the device does not return to standby mode.
$\overline{RE}$	Read Enable	The $\overline{RE}$ input is the serial data-out control, and when active drives the data onto the I/O bus. Data is valid $t_{REA}$ after the falling edge of $\overline{RE}$ which also increments the internal column address counter by one.
$\overline{WE}$	Write Enable	The $\overline{WE}$ input controls writes to the I/O port. Commands, address and data are latched on the rising edge of the $\overline{WE}$ pulse.
$\overline{WP}$	Write Protect	The $\overline{WP}$ pin provides inadvertent program/erase protection during power transitions. The internal high voltage generator is reset when the $\overline{WP}$ pin is active low.
R / $\overline{B}$	Ready / Busy Output	The R / $\overline{B}$ output indicates the status of the device operation. When low, it indicates that a program, erase or random read operation is in process and returns to high state upon completion. It is an open drain output and does not float to Hi-Z condition when the chip is deselected or when outputs are disabled.
$V_{CC}$	Power	$V_{CC}$ is the power supply for device.
$V_{SS}$	Ground	

**Note:** Connect all  $V_{CC}$  and  $V_{SS}$  pins of each device to common power supply outputs. Do not leave  $V_{CC}$  or  $V_{SS}$  disconnected.

## Note:

Column Address: Starting Address of the Register.

\*L must be set to "Low".

\*The device ignores any additional input of address cycles than required.

## Product Introduction

The NAND Flash is a 1,056Mbit memory organized as 64K rows (pages) by 1,056x16 columns. Spare 32x16 columns are located from column address of 1,024~1,055. A 1,056-word data register is connected to memory cell arrays accommodating data transfer between the I/O buffers and memory during page read and page program operations. The program and read operations are executed on a page basis, while the erase operation is executed on a block basis. The memory array consists of 1,024 separately erasable 64K-word blocks. It indicates that the bit-by-bit erase operation is prohibited on the NAND Flash.

The NAND Flash has addresses multiplexed into 16 I/Os. This scheme dramatically reduces pin counts and allows system upgrades to future densities by maintaining consistency in system board design. Command, address and data are all written through I/O's by bringing  $\overline{WE}$  to low while  $\overline{CE}$  is low. Those are latched on the rising edge of  $\overline{WE}$ . Command Latch Enable (CLE) and Address Latch Enable (ALE) are used to multiplex command and address respectively, via the I/O pins. Some commands require one bus cycle. For example, Reset Command, Status Read Command, etc require just one cycle bus. Some other commands, like page read and block erase and page program, require two cycles: one cycle for setup and the other cycle for execution.

In addition to the enhanced architecture and interface, the NAND Flash incorporates copy-back program feature from one page to another page without need for transporting the data to and from the external buffer memory.

## Command Set

Function	1st Cycle	2nd Cycle	Acceptable Command during Busy
Read	00h	30h	
Read for Copy Back	00h	35h	
Read ID	90h	-	
Reset	FFh	-	0
Page Program	80h	10h	
Copy-Back Program	85h	10h	
Block Erase	60h	D0h	
Random Data Input <sup>(1)</sup>	85h	-	
Random Data Output <sup>(1)</sup>	05h	E0h	
Read Status	70h	-	0
Cache Program	80h	15h	
Cache Read	31h		
Read Start for Last Page Cache Read	3Fh		

### Note:

1. Random Data Input / Output can be executed in a page.

**ABSOLUTE MAXIMUM RATINGS**

Parameter	Symbol	Rating	Unit
Voltage on any pin relative to $V_{SS}$	$V_{CC}$	-0.6 to +2.45	V
	$V_{IN}$	-0.6 to +2.45	
	$V_{I/O}$	-0.6 to $V_{CC} + 0.3$ (<2.45)	
Temperature Under Bias	$T_{BIAS}$	-40 to +125	°C
Storage Temperature	$T_{STG}$	-65 to +150	°C
Short Circuit Current	$I_{OS}$	5	mA

**Note:**

1. Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**RECOMMENDED OPERATING CONDITIONS**(Voltage reference to GND,  $T_A = -25$  to  $85^\circ\text{C}$ )

Parameter	Symbol	Min.	Typ.	Max.	Unit
Supply Voltage	$V_{CC}$	1.7	1.8	1.95	V
Supply Voltage	$V_{SS}$	0	0	0	V

**DC AND OPERATION CHARACTERISTICS**

(Recommended operating conditions otherwise noted)

Parameter		Symbol	Test Conditions	Min.	Typ.	Max.	Unit
Operating Current	Page Read with Serial Access	I <sub>CC1</sub>	t <sub>RC</sub> =45ns, $\overline{CE}=V_{IL}$ , I <sub>OUT</sub> =0mA	-	15	30	mA
	Program	I <sub>CC2</sub>	-	-	15		
	Erase	I <sub>CC3</sub>	-	-	15		
Stand-by Current (TTL)		I <sub>SB1</sub>	$\overline{CE}=V_{IH}$ , $\overline{WP}=0V/V_{CC}$	-	-	1	mA
Stand-by Current (CMOS)		I <sub>SB2</sub>	$\overline{CE}=V_{CC}-0.2$ , $\overline{WP}=0V/V_{CC}$	-	10	50	uA
Input Leakage Current		I <sub>LI</sub> <sup>(1)</sup>	V <sub>IN</sub> =0 to V <sub>CC</sub> (max)	-	-	±10	uA
Output Leakage Current		I <sub>LO</sub> <sup>(1)</sup>	V <sub>OUT</sub> =0 to V <sub>CC</sub> (max)	-	-	±10	uA
Input High Voltage		V <sub>IH</sub>	-	0.8 x V <sub>CC</sub>	-	V <sub>CC</sub> +0.3	V
Input Low Voltage, All inputs		V <sub>IL</sub>	-	-0.3	-	0.2 x V <sub>CC</sub>	V
Output High Voltage Level		V <sub>OH</sub>	I <sub>OH</sub> =-100uA	V <sub>CC</sub> -0.1	-	-	V
Output Low Voltage Level		V <sub>OL</sub>	I <sub>OL</sub> =+100uA	-	-	0.1	V
Output Low Current (R/B)		I <sub>OL</sub> (R / $\overline{B}$ )	V <sub>OL</sub> =0.1V	3	4	-	mA

**Note:**

1.  $V_{IL}$  can undershoot to -0.4V and  $V_{IH}$  can overshoot to  $V_{CC}+0.4\text{V}$  for durations of 20ns or less.
2. Typical value are measured at  $V_{CC}=1.8\text{V}$ ,  $T_A=25^\circ\text{C}$ . And not 100% tested.

**VALID BLOCK**

Symbol	Min.	Typ.	Max.	Unit
$N_{VB}$	1,004	-	1,024	Blocks

**Note:**

1. The device may include initial invalid blocks when first shipped. Additional invalid blocks may develop while being used. The number of valid blocks is presented as first shipped. Invalid blocks are defined as blocks that contain one or more bad bits which cause status failure during program and erase operation. Do not erase or program factory-marked bad blocks. Refer to the attached technical notes for appropriate management of initial invalid blocks.
2. The 1st block, which is placed on 00h block address, is guaranteed to be a valid block at the time of shipment and is guaranteed to be a valid block up to 1K program/erase cycles with 1bit/264 words ECC.

**AC TEST CONDITION**(T<sub>A</sub>= -25 to 85 °C, V<sub>CC</sub>=1.7V~1.95V)

Parameter	Condition
Input Pulse Levels	0V to V <sub>CC</sub>
Input Rise and Fall Times	5 ns
Input and Output Timing Levels	V <sub>CC</sub> /2
Output Load*	1 TTL Gate and C <sub>L</sub> =30pF

**Note:** \* Refer to Ready /  $\overline{\text{Busy}}$  section, R/ $\overline{\text{B}}$  output's Busy to Ready time is decided by the pull-up resistor (R<sub>P</sub>) tied to R/ $\overline{\text{B}}$  pin.

**CAPACITANCE**(T<sub>A</sub>=25°C, V<sub>CC</sub>=1.8V, f=1.0MHz)

Item	Symbol	Test Condition	Min.	Max.	Unit
Input / Output Capacitance	C <sub>I/O</sub>	V <sub>IL</sub> = 0V	-	10	pF
Input Capacitance	C <sub>IN</sub>	V <sub>IN</sub> = 0V	-	10	pF

**Note:** Capacitance is periodically sampled and not 100% tested.

**MODE SELECTION**

CLE	ALE	$\overline{\text{CE}}$	$\overline{\text{WE}}$	$\overline{\text{RE}}$	$\overline{\text{WP}}$	Mode	
H	L	L		H	X	Read Mode	Command Input
L	H	L		H	X		Address Input (4 clock)
H	L	L		H	H	Write Mode	Command Input
L	H	L		H	H		Address Input (4 clock)
L	L	L		H	H	Data Input	
L	L	L	H		X	Data Output	
X	X	X	X	H	X	During Read (Busy)	
X	X	X	X	X	H	During Program (Busy)	
X	X	X	X	X	H	During Erase (Busy)	
X	X <sup>(1)</sup>	X	X	X	L	Write Protect	
X	X	H	X	X	0V/V <sub>CC</sub> <sup>(2)</sup>	Stand-by	

**Note:**

- X can be V<sub>IL</sub> or V<sub>IH</sub>.
- $\overline{\text{WP}}$  should be biased to CMOS high or CMOS low for stand-by.

## Program / Erase Characteristics

Parameter	Symbol	Min.	Typ.	Max.	Unit
Program Time	$t_{\text{PROG}}$	-	250	700	us
Dummy Busy Time for Cache Program	$t_{\text{CBSY}}$	-	3	700	us
Number of Partial Program Cycles in the Same Page	$N_{\text{OP}}$	-	-	4	Cycle
Block Erase Time	$t_{\text{BERS}}$	-	2	10	ms

### Note:

1. Typical program time is defined as the time within which more than 50% of the whole pages are programmed at 1.8V  $V_{\text{CC}}$  and 25°C temperature.
2.  $t_{\text{PROG}}$  is the average program time of all pages. Users should be noted that the program time variation from page to page is possible.
3.  $t_{\text{CBSY}}$  max. time depends on timing between internal program completion and data in.

## AC Timing Characteristics for Command / Address / Data Input

Parameter	Symbol	Min.	Max.	Unit
CLE Setup Time	$t_{\text{CLS}}^{(1)}$	25	-	ns
CLE Hold Time	$t_{\text{CLH}}$	10	-	ns
$\overline{\text{CE}}$ Setup Time	$t_{\text{CS}}^{(1)}$	35	-	ns
$\overline{\text{CE}}$ Hold Time	$t_{\text{CH}}$	10	-	ns
$\overline{\text{WE}}$ Pulse Width	$t_{\text{WP}}$	25	-	ns
ALE Setup Time	$t_{\text{ALS}}^{(1)}$	25	-	ns
ALE Hold Time	$t_{\text{ALH}}$	10	-	ns
Data Setup Time	$t_{\text{DS}}^{(1)}$	20	-	ns
Data Hold Time	$t_{\text{DH}}$	10	-	ns
Write Cycle Time	$t_{\text{WC}}$	45	-	ns
$\overline{\text{WE}}$ High Hold Time	$t_{\text{WH}}$	15	-	ns
ALE to Data Loading Time	$t_{\text{ADL}}^{(2)}$	100	-	ns

### Note:

1. The transition of the corresponding control pins must occur only once while  $\overline{\text{WE}}$  is held low.
2.  $t_{\text{ADL}}$  is the time from the  $\overline{\text{WE}}$  rising edge of final address cycle to the  $\overline{\text{WE}}$  rising edge of first data cycle.

## AC Characteristics for Operation

Parameter	Symbol	Min.	Max.	Unit
Data Transfer from Cell to Register	$t_R$	-	25	us
ALE to $\overline{RE}$ Delay	$t_{AR}$	10	-	ns
CLE to $\overline{RE}$ Delay	$t_{CLR}$	10	-	ns
Ready to $\overline{RE}$ Low	$t_{RR}$	20	-	ns
$\overline{RE}$ Pulse Width	$t_{RP}$	25	-	ns
$\overline{WE}$ High to Busy	$t_{WB}$	-	100	ns
$\overline{WP}$ Low to $\overline{WE}$ Low (disable mode)	$t_{WW}$	100	-	ns
$\overline{WP}$ High to $\overline{WE}$ Low (enable mode)				
Read Cycle Time	$t_{RC}$	45	-	ns
$\overline{RE}$ Access Time	$t_{REA}$	-	30	ns
$\overline{CE}$ Access Time	$t_{CEA}$	-	45	ns
$\overline{RE}$ High to Output Hi-Z	$t_{RHZ}$	-	100	ns
$\overline{CE}$ High to Output Hi-Z	$t_{CHZ}$	-	30	ns
$\overline{CE}$ High to ALE or CLE Don't care	$t_{CSD}$	0	-	ns
$\overline{RE}$ High to Output Hold	$t_{RHOH}$	15	-	ns
$\overline{RE}$ Low to Output Hold	$t_{RLOH}$	5	-	ns
$\overline{CE}$ High to Output Hold	$t_{COH}$	15	-	ns
$\overline{RE}$ High Hold Time	$t_{REH}$	15	-	ns
Output Hi-Z to $\overline{RE}$ Low	$t_{IR}$	0	-	ns
$\overline{RE}$ High to $\overline{WE}$ Low	$t_{RHW}$	100	-	ns
$\overline{WE}$ High to $\overline{RE}$ Low	$t_{WHR}$	60	-	ns
Device Resetting Time during ...	Read	$t_{RST}$	5	us
	Program		10	us
	Erase		500	us
	Ready		5 <sup>(1)</sup>	us
Cache Busy in Read Cache (following 31h and 3Fh)	$t_{DCBSYR}$	-	30	us

### Note:

1. If reset command (FFh) is written at Ready state, the device goes into Busy for maximum 5us.

## NAND Flash Technical Notes

### Mask Out Initial Invalid Block(s)

Initial invalid blocks are defined as blocks that contain one or more initial invalid bits whose reliability is not guaranteed by MIRA. The information regarding the initial invalid block(s) is called as the initial invalid block information. Devices with initial invalid block(s) have the same quality level as devices with all valid blocks and have the same AC and DC characteristics. An initial invalid block(s) does not affect the performance of valid block(s) because it is isolated from the bit line and the common source line by a select transistor. The system design must be able to mask out the initial invalid block(s) via address mapping.

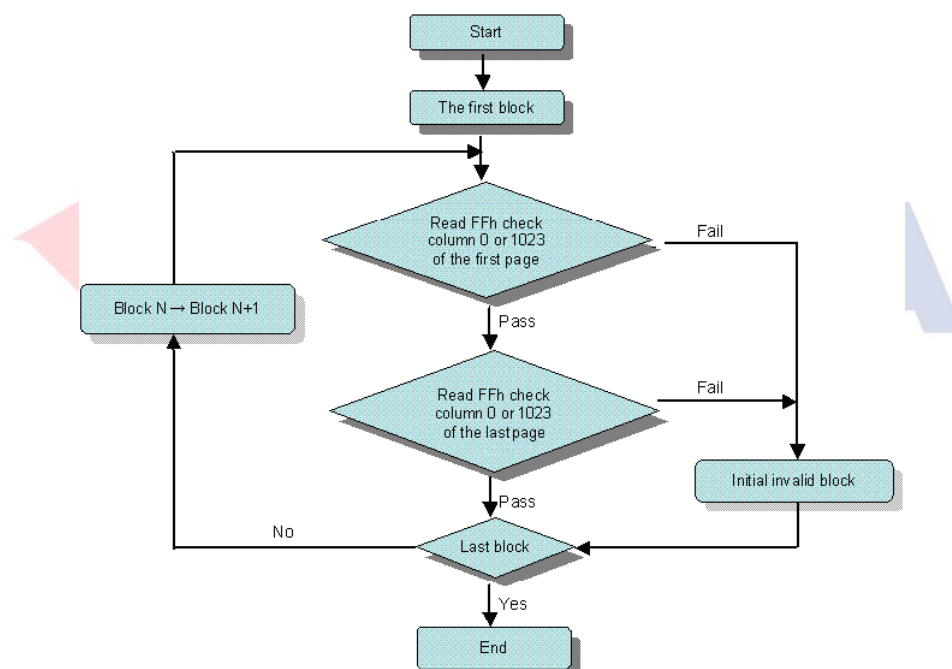

The 1st block, which is placed on 00h block address, is guaranteed to be a valid block up to 1K program/erase cycles with 1 bit/264 words ECC.

### Identifying Initial Invalid Block(s) and Block Replacement Management

Unpredictable behavior may result from programming or erasing the defective blocks. The under figure illustrates an algorithm for searching factory-mapped defects, and the algorithm needs to be executed prior to any erase or program operations.

A host controller has to scan blocks from block 0 to the last block using page read command and check the data at the column address of 0 or 1,023. If the read data is not FFh, the block is interpreted as an invalid block. The initial invalid block information is erasable, and which is impossible to be recovered once it has been erased. Therefore, the host controller must be able to recognize the initial invalid block information and to create a corresponding table to manage block replacement upon erase or program error when additional invalid blocks develop with Flash memory usage.

Algorithm for Bad Block Scanning

```
For (i=0; i<Num_of_LUs; i++)
{
    For (j=0; j<Blocks_Per_LU; j++)
    {
        Defect_Block_Found=False;
        Read_Page(lu=i, block=j, page=0);
        If (Data[column=0]!=FFh) Defect_Block_Found=True;
        If (Data[column=First_Byte_of_Spare_Area]!=FFh) Defect_Block_Found=True;
        Read_Page(lu=i, block=j, page=Page_Per_Block-1);
        If (Data[column=0]!=FFh) Defect_Block_Found=True;
        If (Data[column=First_Byte_of_Spare_Area]!=FFh) Defect_Block_Found=True;
        If (Defect_Block_Found) Mark_Block_as_Defective(lu=i, block=j);
    }
}
```

## Error in Write or Read operation

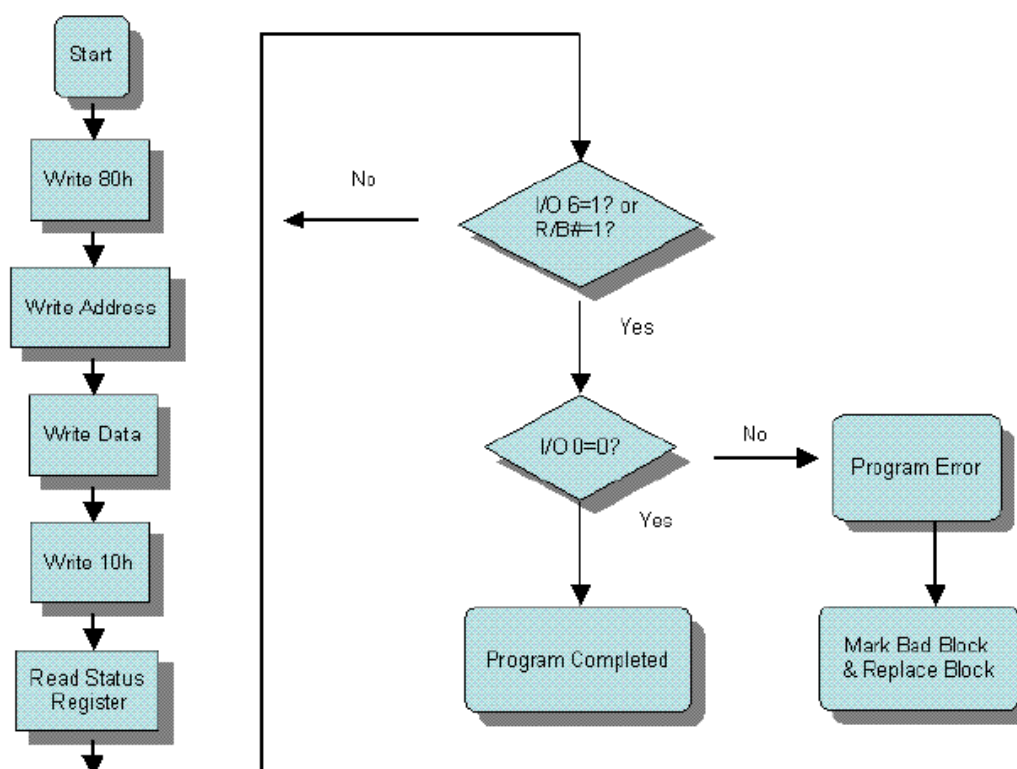

Within its lifetime, additional invalid blocks may develop with NAND Flash memory. Refer to the qualification report for the actual data. The following possible failure modes should be considered to implement a highly reliable system. In the case of status read failure after erase or program, block replacement should be done. Because program status fail during a page program does not affect the data of the other pages in the same block, block replacement can be executed with a page-sized buffer by finding an erased empty block and reprogramming the current target data and copying the rest of the replaced block. In case of Read, ECC must be employed. To improve the efficiency of memory space, it is recommended that the read or verification failure due to single bit error be reclaimed by ECC without any block replacement. The additional block failure rate does not include those reclaimed blocks.

Failure Mode		Detection and Countermeasure sequence
Write	Erase failure	Read Status after Erase → Block Replacement
	Program failure	Read Status after Program → Block Replacement
Read	Single bits failure	Verify ECC → ECC Correction

**Note:** Error Correcting Code --> Hamming Code etc.

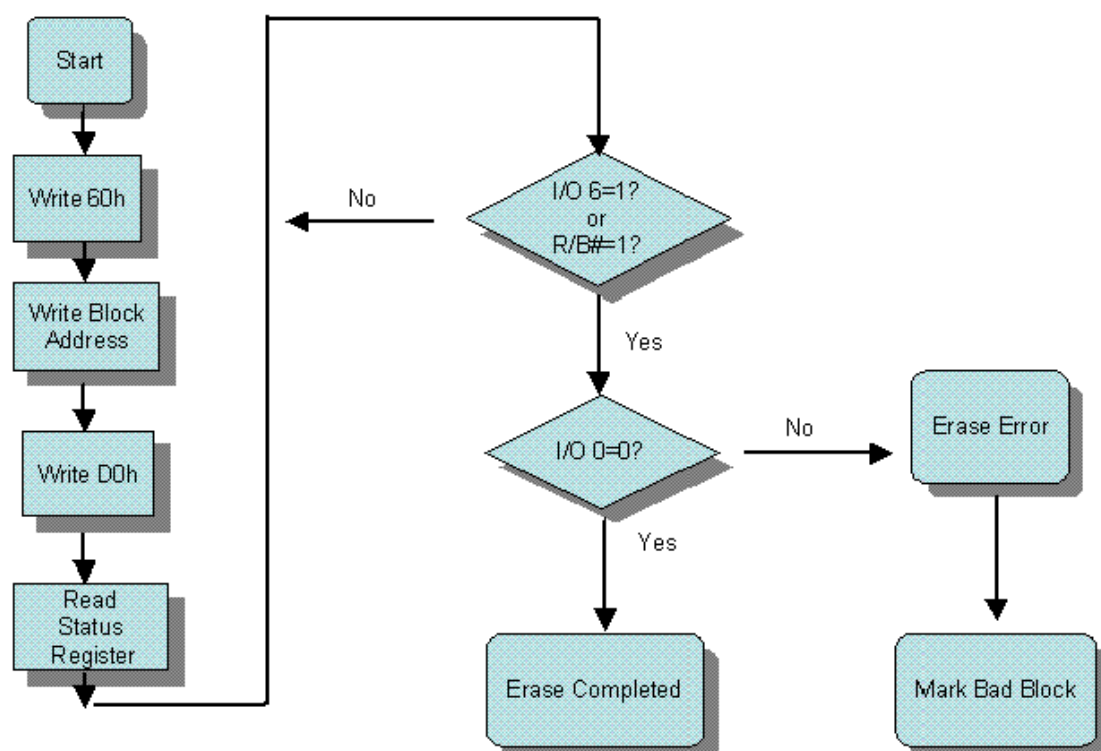

Example: 1bit correction / 264 words

### Read Flow Chart

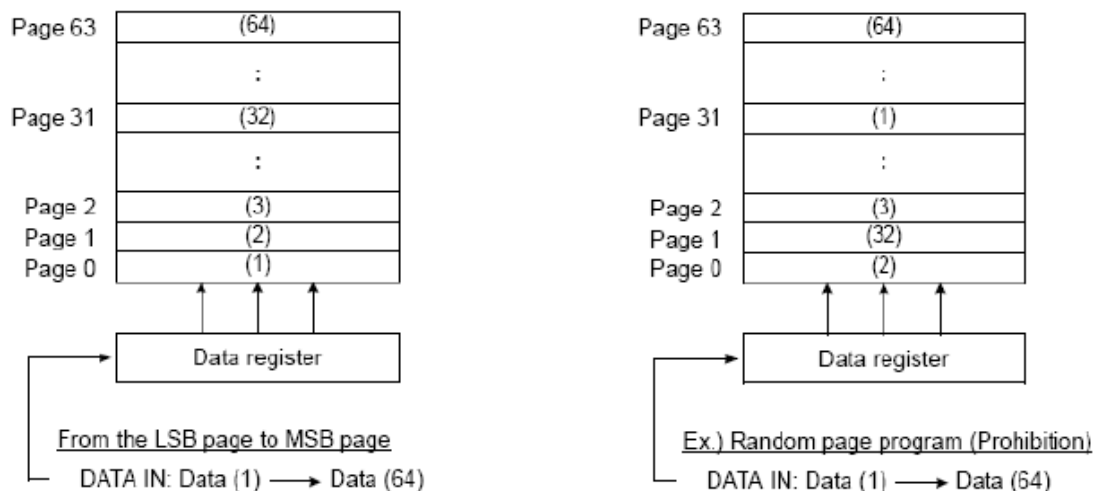

## Block Replacement

## Addressing for Program Operation

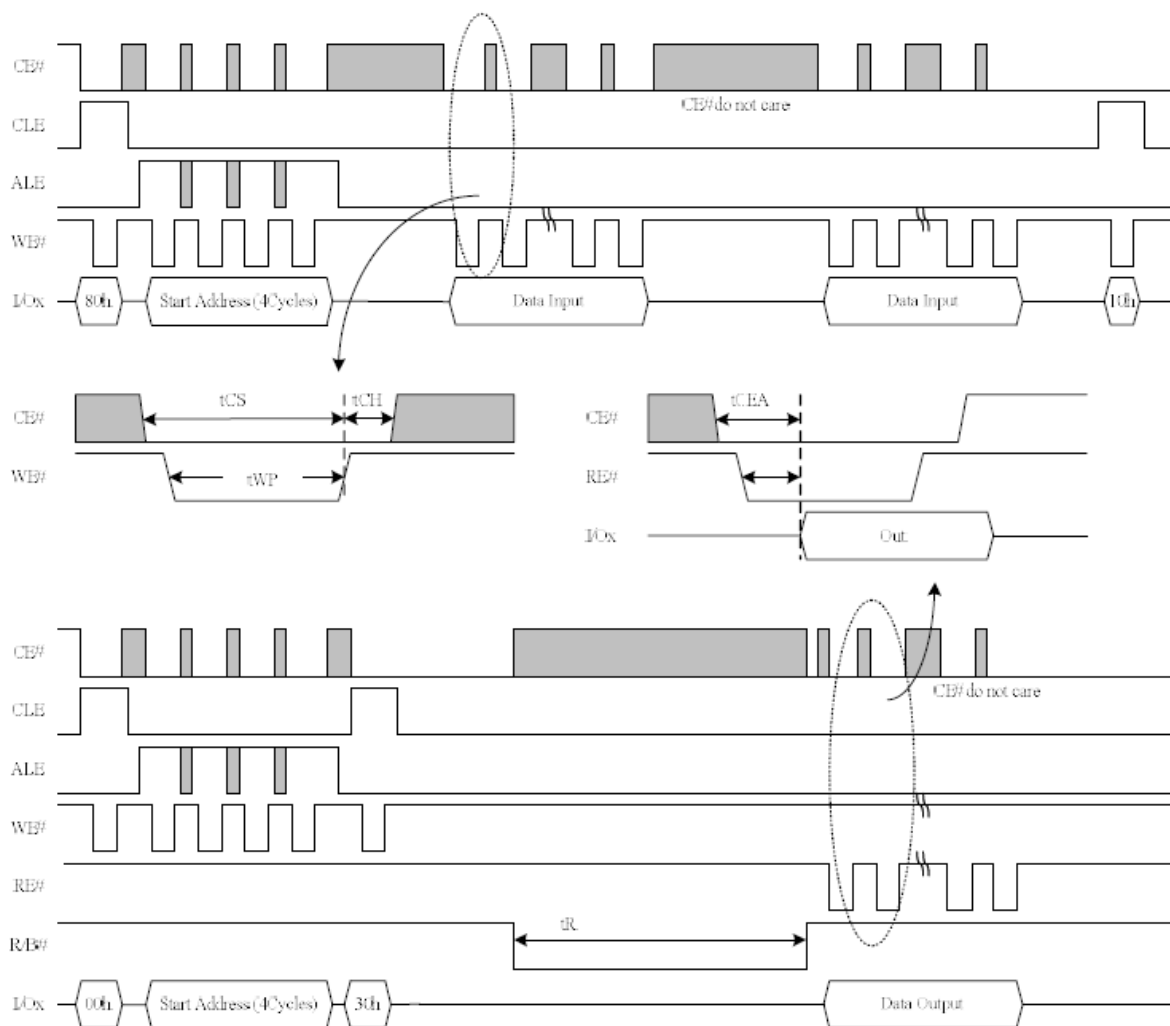

Within a block, the pages must be programmed consecutively from the LSB (least significant bit) page of the block to MSB (most significant bit) pages of the block. Random page address programming is prohibited. In this case, the definition of LSB page is the LSB among the pages to be programmed. Therefore, LSB page doesn't need to be page 0.

## System Interface Using $\overline{\text{CE}}$ Don't Care

For an easier system interface,  $\overline{\text{CE}}$  may be inactive during the data-loading or serial access as shown below. The internal 1,056-word data registers are utilized as separate buffers for this operation and the system design gets more flexible. In addition, for voice or audio applications that use slow cycle time on the order of  $\mu$ -seconds, de-activating  $\overline{\text{CE}}$  during the data-loading and serial access would provide significant savings in power consumption.

### Program / Read Operation with “ $\overline{\text{CE}}$ not-care”

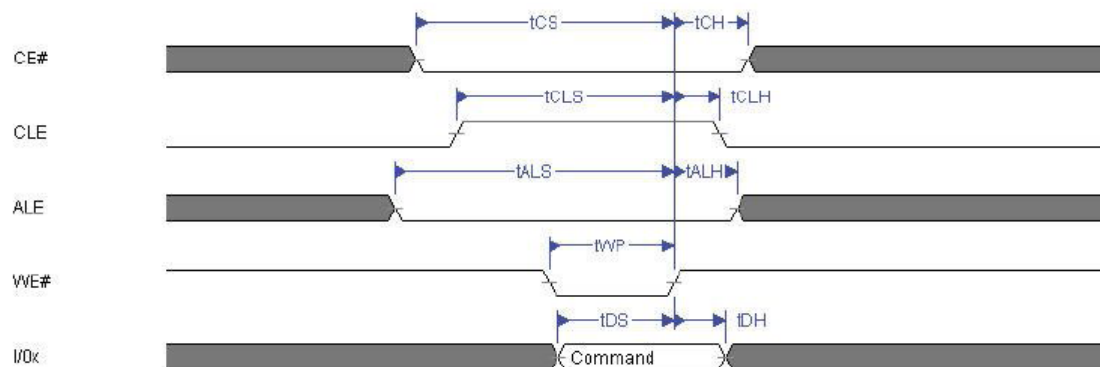

## Address Information

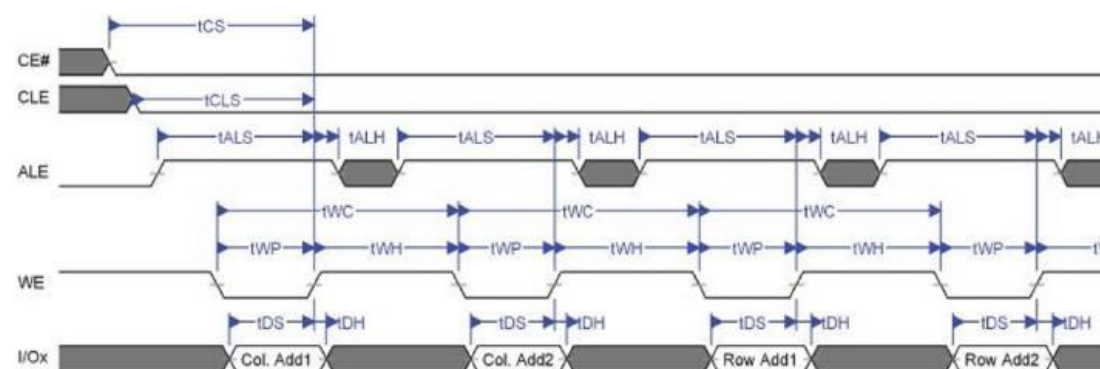

Data	I/O	Address			
Data In/Out	I/Ox	Col. Add1	Col. Add2	Row Add1	Row Add2
1,056 Words	I/O 0 ~ I/O 15	A0 ~ A7	A8 ~ A10	A11 ~ A18	A19 ~ A26

## Timing Diagrams

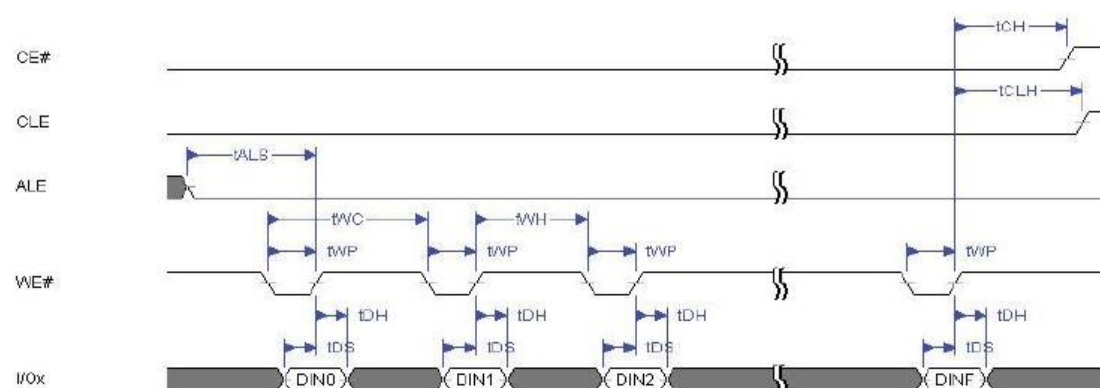

### Command Latch Cycle

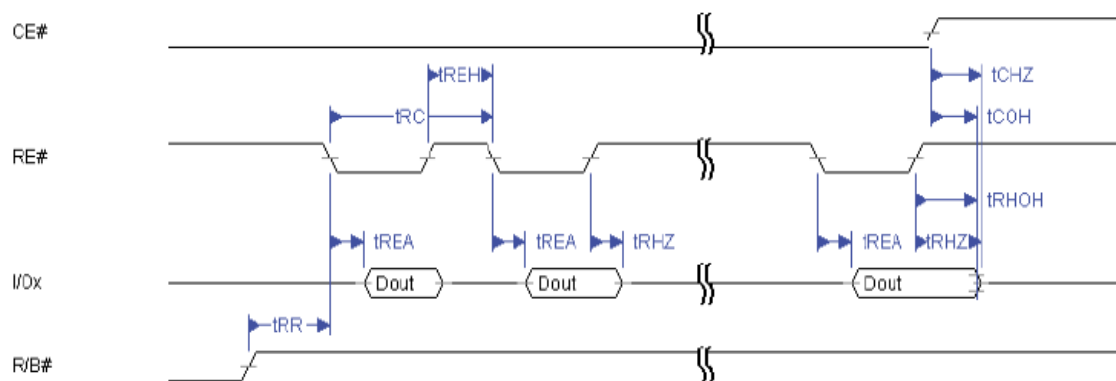

### Address Latch Cycle

### Input Data Latch Cycle

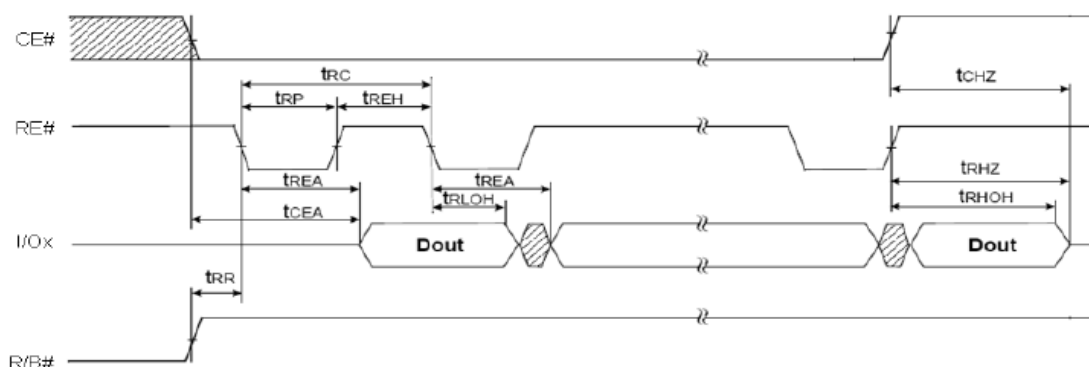

### Serial Access Cycle after Read (CLE = L, $\overline{\text{WE}} = \text{H}$ , ALE = L)

**NOTE:**

1. Dout transition is measured at  $\pm 200\text{mV}$  from steady state voltage at I/O with load.
2.  $t_{\text{RHOH}}$  starts to be valid when frequency is lower than 20MHz.

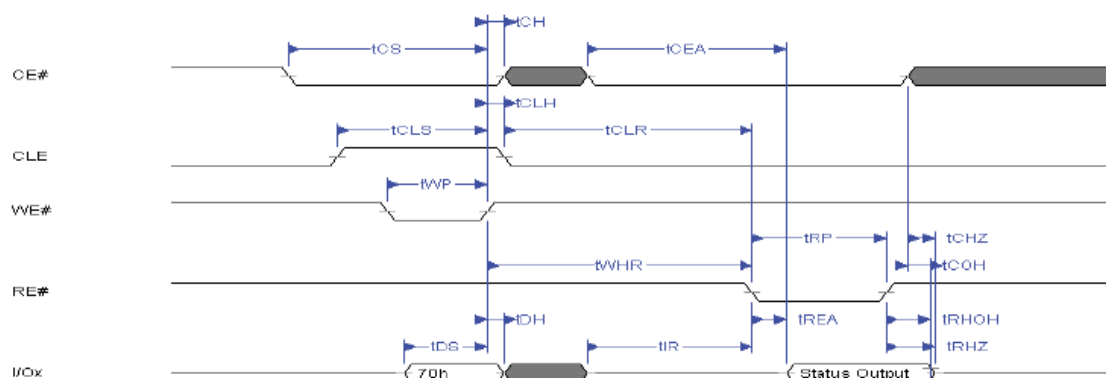

**Serial Access Cycle after Read (EDO Type CLE = L,  $\overline{WE}$  = H, ALE = L)**

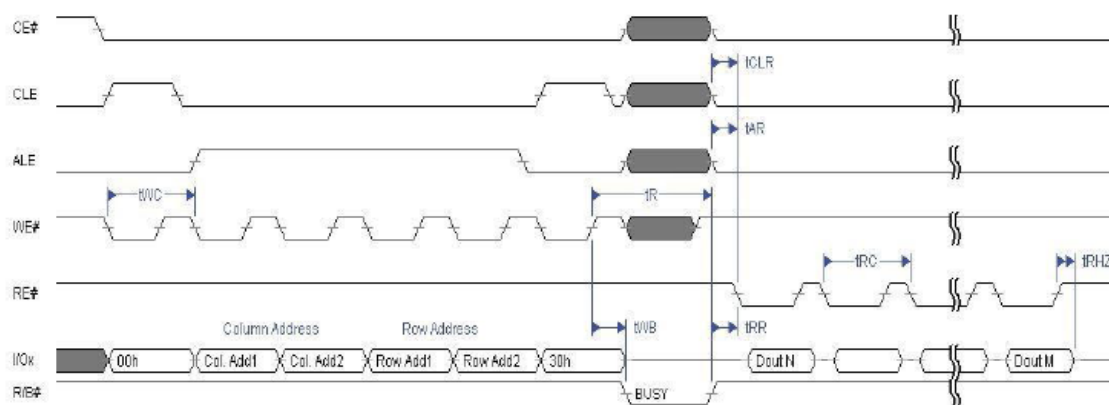

**NOTE:**

1. Transition is measured at  $\pm 200\text{mV}$  from steady state voltage with load. This parameter is sample and not 100% tested. ( $t_{CHZ}$ ,  $t_{RHZ}$ )
2.  $t_{RLOH}$  is valid when frequency is higher than 20MHZ.  
 $t_{RHOH}$  starts to be valid when frequency is lower than 20MHZ.

Publication Date: May. 2012  
Revision: 0.2 22/94

The diagram illustrates two scenarios for I/O operations:

- Top Scenario (Successful Program):** Shows a sequence of operations starting with Column Address N, followed by Row Address, and then Column Address J. The I/O data bus (I/Ox) shows data 80h, Col. Add1, Col. Add2, Row Add1, Row Add2, Din N, Din M, 85h, Col. Add1, Col. Add2, and Din J. The R/B# signal is active during the data transfer. A dashed line labeled '1' indicates the start of the successful program.
- Bottom Scenario (Error Program):** Shows a sequence of operations starting with Column Address J, followed by Row Address, and then Column Address J. The I/O data bus (I/Ox) shows data 85h, Col. Add1, Col. Add2, Din J, Din K, 10h, 70h, and I/O0. The R/B# signal is active during the data transfer. A dashed line labeled '1' indicates the start of the error program. The I/O0 signal is active during the error program.

Legend:

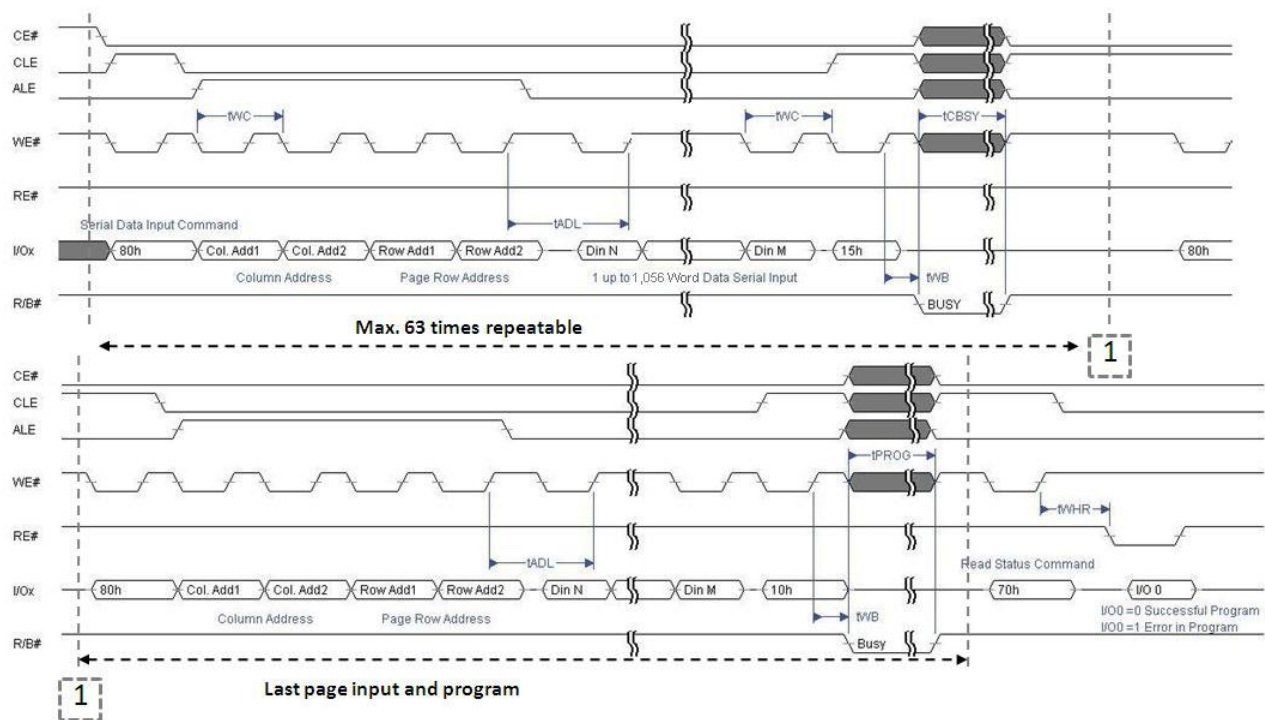

- I/O0 = 0 Successful Program
- I/O0 = 1 Error in Program

## Device Operation

### Page Read

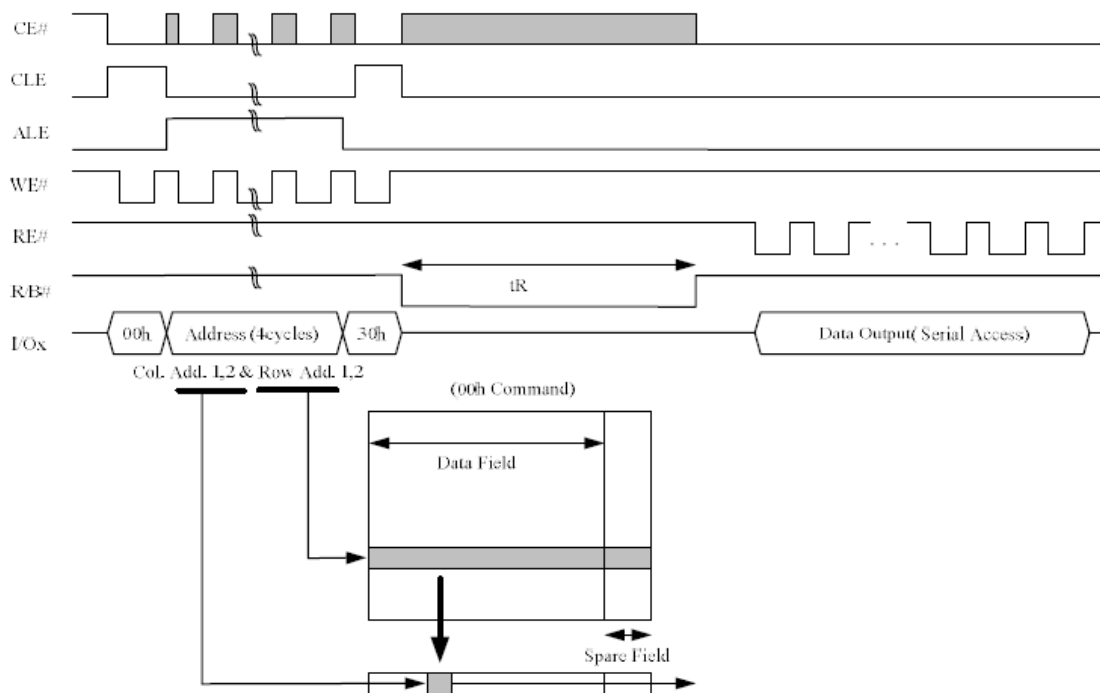

Upon initial device power up, the device defaults to Read mode. This operation is also initiated by writing 00h command, four-cycle address, and 30h command. After initial power up, the 00h command can be skipped because it has been latched in the command register. The 1,056 words of data on a page are transferred to cache registers via data registers within 25 $\mu$ s ( $t_R$ ). Host controller can detect the completion of this data transfer by checking the  $R/\bar{B}$  output. Once data in the selected page have been loaded into cache registers, each Byte can be read out in 45ns cycle time by continuously pulsing  $\bar{R}E$ . The repetitive high-to-low transitions of  $\bar{R}E$  clock signal make the device output data starting from the designated column address to the last column address.

The device can output data at a random column address instead of sequential column address by using the Random Data Output command. Random Data Output command can be executed multiple times in a page.

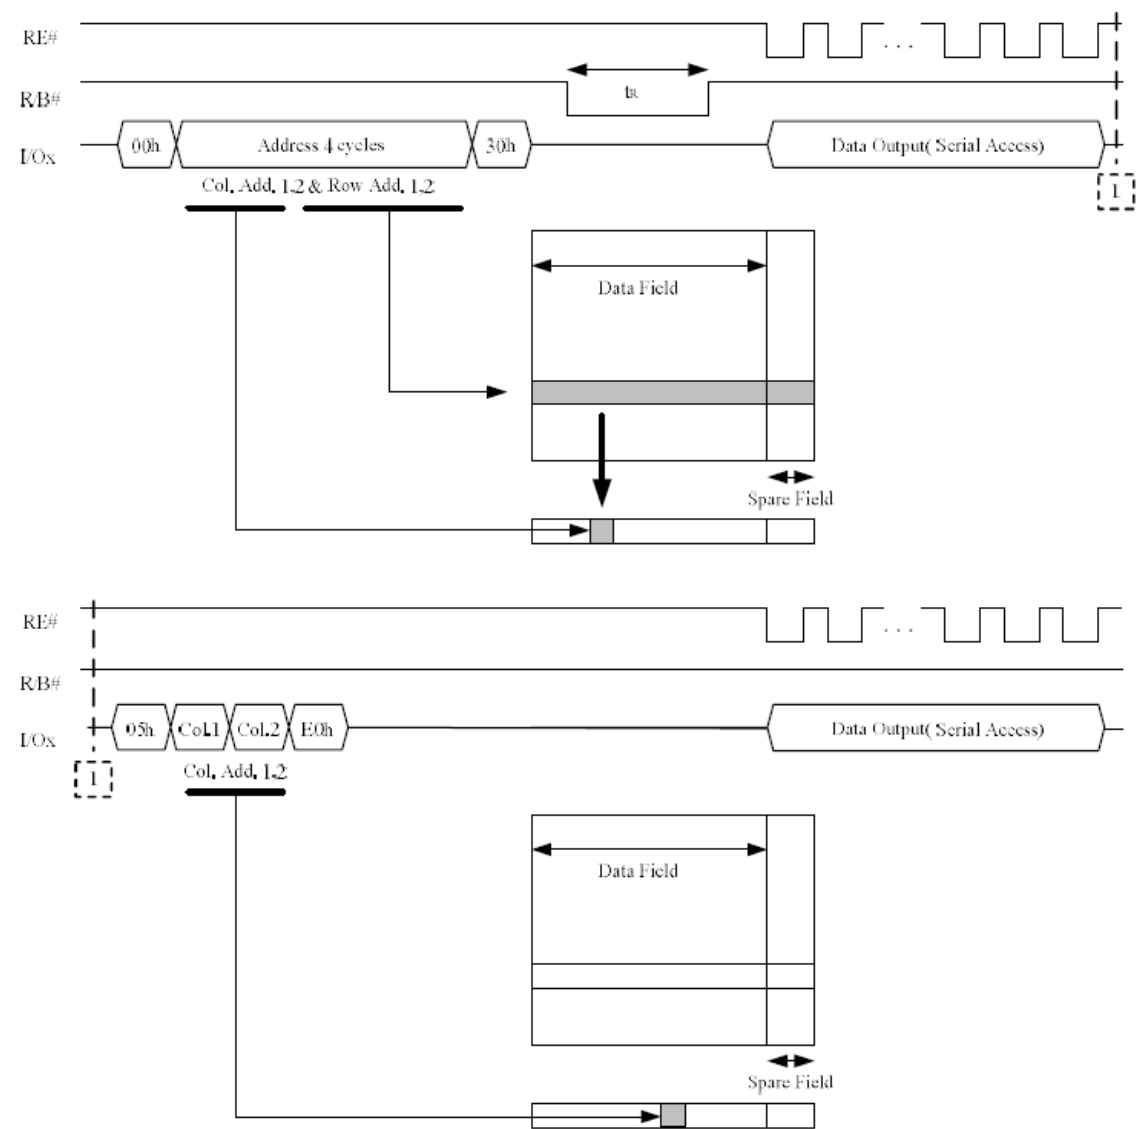

After power up, device is in read mode so 00h command cycle is not necessary to start a read operation.

A page read sequence is illustrated in under figure, where column address, page address are placed in between commands 00h and 30h. After  $t_R$  read time, the  $R/\bar{B}$  de-asserts to ready state. Read Status command (70h) can be issued right after 30h. Host controller can toggle  $\bar{R}E$  to access data starting with the designated column address and their successive bytes.

### Read Operation

Random Data Output In a Page

## Page Program

The device is programmed based on the unit of a page, and consecutive partial page programming on one page without intervening erase operation is strictly prohibited. Addressing of page program operations within a block should be in sequential order. A complete page program cycle consists of a serial data input cycle in which up to 1,056 words of data can be loaded into data register via cache register, followed by a programming period during which the loaded data are programmed into the designated memory cells.

The serial data input cycle begins with the Serial Data Input command (80h), followed by a four-cycle address input and then serial data loading. The bytes not to be programmed on the page do not need to be loaded. The column address for the next data can be changed to the address follows Random Data Input command (85h). Random Data Input command may be repeated multiple times in a page. The Page Program Confirm command (10h) starts the programming process. Writing 10h alone without entering data will not initiate the programming process. The internal write engine automatically executes the corresponding algorithm and controls timing for programming and verification, thereby freeing the host controller for other tasks. Once the program process starts, the host controller can detect the completion of a program cycle by monitoring the R/B $\bar$  output or reading the Status bit (I/O6) using the Read Status command. Only Read Status and Reset commands are valid during programming. When the Page Program operation is completed, the host controller can check the Status bit (I/O0) to see if the Page Program operation is successfully done. The command register remains the Read Status mode unless another valid command is written to it.

A page program sequence is illustrated in under figure, where column address, page address, and data input are placed in between 80h and 10h. After  $t_{\text{PROG}}$  program time, the R/B $\bar$  de-asserts to ready state. Read Status command (70h) can be issued right after 10h.

## Program & Read Status Operation

## Random Data Input In a Page

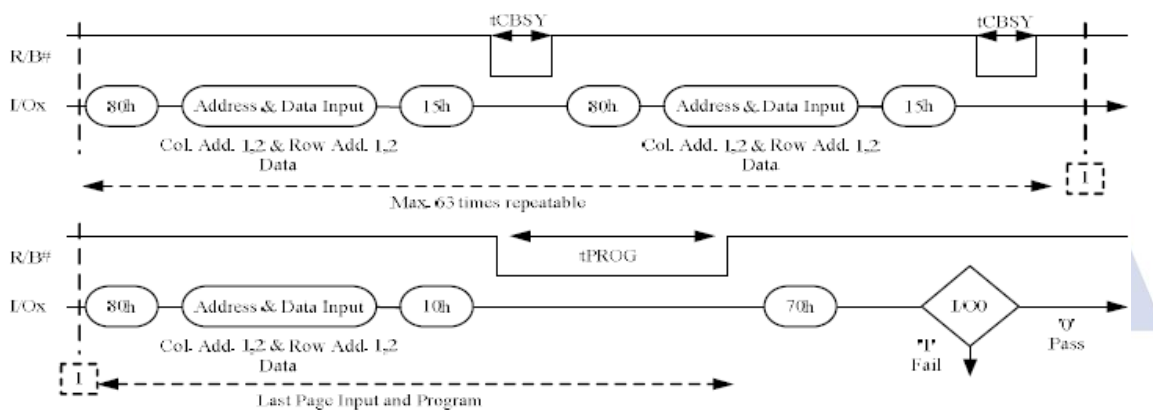

## Cache Program

Cache Program is an extension of Page Program, which is executed with 1,056-word data registers, and is available only within a block. Since the device has 1 page of cache memory, serial data input may be executed while data stored in data register are programmed into memory cell.

After writing the first set of data up to 1,056 words into the selected cache registers, Cache Program command (15h) instead of actual Page Program (10h) is inputted to make cache registers free and to start internal program operation. To transfer data from cache registers to data registers, the device remains in Busy state for a short period of time ( $t_{CBSY}$ ) and has its cache registers ready for the next data-input while the internal programming gets started with the data loaded into data registers. Read Status command (70h) may be issued to find out when cache registers become ready by polling the Cache-Busy status bit (I/O6). Pass/fail status of only the previous page is available upon the return to Ready state. When the next set of data is inputted with the Cache Program command,  $t_{CBSY}$  is affected by the progress of pending internal programming. The programming of the cache registers is initiated only when the pending program cycle is finished and the data registers are available for the transfer of data from cache registers. The status bit (I/O5) for internal Ready/Busy may be polled to identify the completion of internal programming. If the system monitors the progress of programming only with  $R/\bar{B}$ , the last page of the target programming sequence must be programmed with actual Page Program command (10h).

### Cache Program (available only within a block)

#### Note:

1. Since programming the last page does not employ caching, the program time has to be that of Page Program. However, if the previous program cycle with the cache data has not finished, the actual program cycle of the last page is initiated only after completion of the previous cycle, which can be expressed as the following formula.
2.  $t_{PROG} = \text{Program time for the last page} + \text{Program time for the (last-1)th page} - (\text{Program command cycle time} + \text{Last page data loading time})$

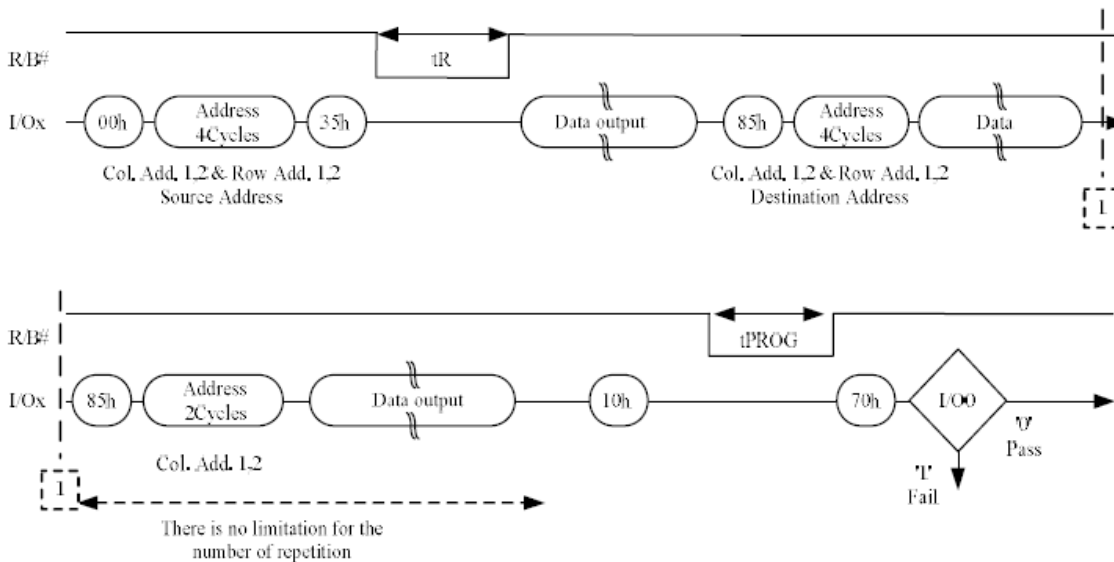

### Copy-Back Program

Copy-Back Program is designed to efficiently copy data stored in memory cells without time-consuming data reloading when there is no bit error detected in the stored data. The benefit is particularly obvious when a portion of a block is updated and the rest of the block needs to be copied to a newly assigned empty block. Copy-Back operation is a sequential execution of Read for Copy-Back and of Copy-Back Program with Destination address. A Read for Copy-Back operation with “35h” command and the Source address moves the whole 1,056-word data into the internal buffer. The host controller can detect bit errors by sequentially reading the data output. Copy-Back Program is initiated by issuing Page-Copy Data-Input command (85h) with Destination address. If data modification is necessary to correct bit errors and to avoid error propagation, data can be reloaded after the Destination address. Data modification can be repeated multiple times as shown in under figure. Actual programming operation begins when Program Confirm command (10h) is issued. Once the program process starts, the Read Status command (70h) may be entered to read the status register. The host controller can detect the completion of a program cycle by monitoring the R/B<sup>̄</sup> output, or the Status bit (I/O6) of the Status Register. When the Copy-Back Program is complete, the Status Bit (I/O0) may be checked. The command register remains Read Status mode until another valid command is written to it.

### Page Copy-Back Program Operation

### Page Copy-Back Program Operation with Random Data Input

## Block Erase

The block-based Erase operation is initiated by an Erase Setup command (60h), followed by a two-cycle row address, in which only Plane address and Block address are valid while Page address is ignored. The Erase Confirm command (D0h) following the row address starts the internal erasing process. The two-step command sequence is designed to prevent memory content from being inadvertently changed by external noise. At the rising edge of  $\overline{WE}$  after the Erase Confirm command input, the internal control logic handles erase and erase-verify. When the erase operation is completed, the host controller can check Status bit (I/O0) to see if the erase operation is successfully done. The under figure illustrates a block erase sequence, and the address input (the first page address of the selected block) is placed in between commands 60h and D0h. After  $t_{BERASE}$  erase time, the  $R/\overline{B}$  de-asserts to ready state. Read Status command (70h) can be issued right after D0h to check the execution status of erase operation.

## Block Erase Operation

## Read Status

A status register on the device is used to check whether program or erase operation is completed and whether the operation is completed successfully. After writing 70h command to the command register, a read cycle outputs the content of the status register to I/O pins on the falling edge of  $\overline{CE}$  or  $\overline{RE}$ , whichever occurs last. These two commands allow the system to poll the progress of each device in multiple memory connections even when  $R/\overline{B}$  pins are common-wired.  $\overline{RE}$  or  $\overline{CE}$  does not need to toggle for status change.

The command register remains in Read Status mode unless other commands are issued to it. Therefore, if the status register is read during a random read cycle, a read command (00h) is needed to start read cycles.

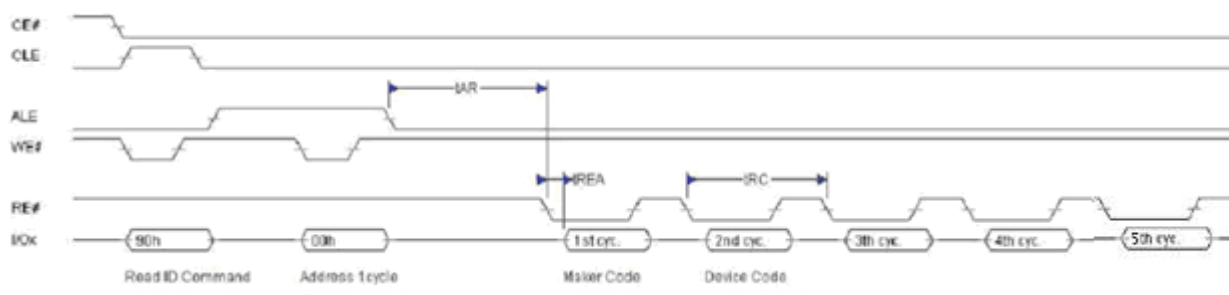

## Status Register Definition for 70h Command

I/O	Page Program	Block Erase	Read	Cache Read	Definition
I/O0	Pass / Fail	Pass / Fail	NA	NA	Pass: 0 Fail: 1
I/O1	NA	NA	NA	NA	Don't cared
I/O2	NA	NA	NA	NA	Don't cared
I/O3	NA	NA	NA	NA	Don't cared
I/O4	NA	NA	NA	NA	Don't cared
I/O5	NA	NA	NA	True Ready / Busy	Busy: 0 Ready: 1
I/O6	Ready / Busy	Ready / Busy	Ready / Busy	Ready / Busy	Busy: 0 Ready: 1
I/O7	Write Protect	Write Protect	Write Protect	Write Protect	Protected: 0 Not Protected: 1

## Read ID

The device contains a product identification mode, initiated by writing 90h to the command register, followed by an address input of 00h. Four read cycles sequentially output the manufacturer code (C8h), and the device code and 3rd, 4th cycle ID respectively. The command register remains in Read ID mode until further commands are issued to it.

### Read ID Operation

### ID Definition Table

1 <sup>st</sup> Cycle (Maker Code)	2 <sup>nd</sup> Cycle (Device Code)	3 <sup>rd</sup> Cycle	4 <sup>th</sup> Cycle	5 <sup>th</sup> Cycle
C8h	B1h	80h	55h	40h

## Reset

The device offers a reset feature, executed by writing FFh to the command register. When the device is in Busy state during random read, program or erase mode, the reset operation will abort these operations. The contents of memory cells being altered are no longer valid, as the data will be partially programmed or erased. The command register is cleared to wait for the next command, and the Status Register is cleared to value C0h when  $\overline{WP}$  is high. If the device is already in reset state a new reset command will be accepted by the command register. The  $\overline{R/B}$  pin changes to low for t<sub>RST</sub> after the Reset command is written. Refer to the figure below.

### Reset Operation

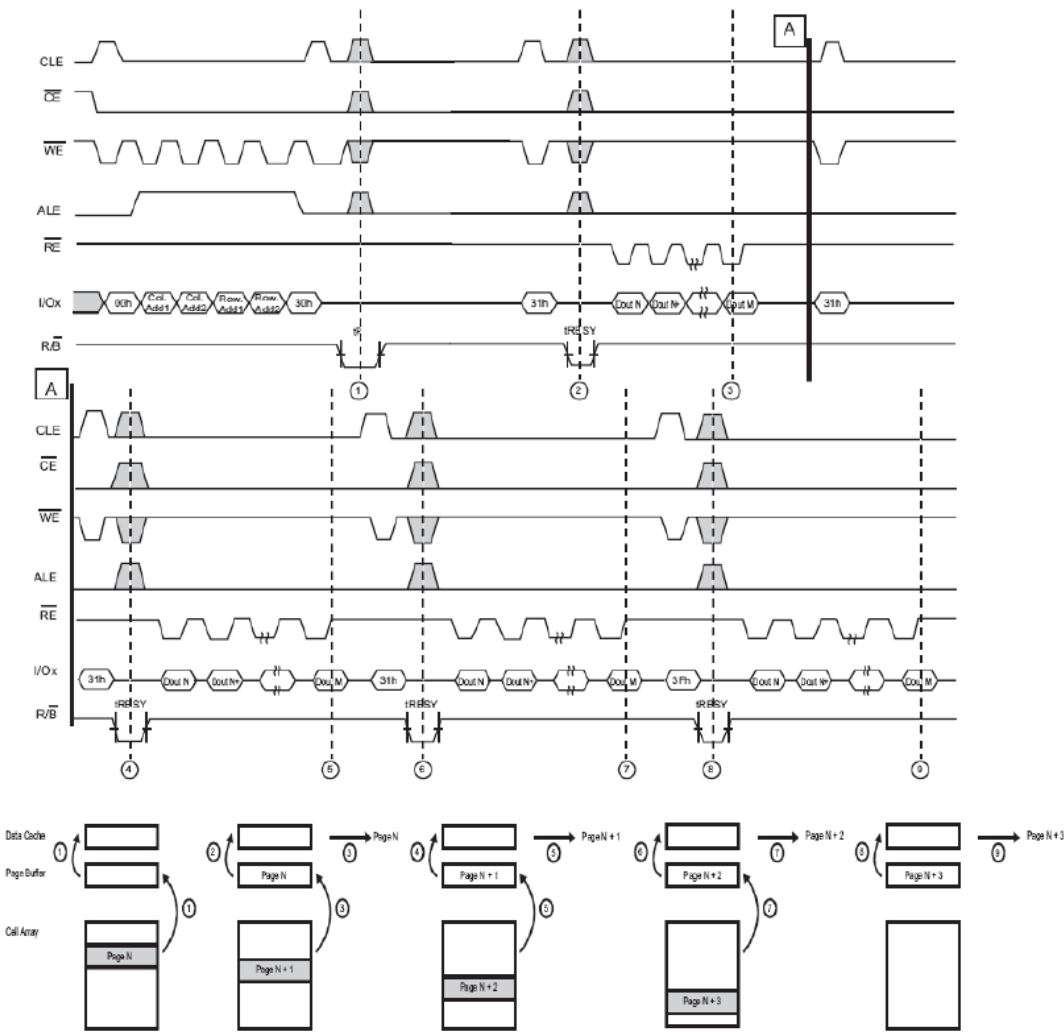

### Device Status Table

	After Power-up	After Reset
Operation Mode	00h Command is latched	Waiting for next command

Cache Read

Cache Read is an extension of Page Read, and is available only within a block. The normal Page Read command (00h-30h) is always issued before invoking Cache Read. After issuing the Cache Read command (31h), read data of the designated page (page N) are transferred from data registers to cache registers in a short time period of  $t_{DCBSYR}$ , and then data of the next page (page N+1) is transferred to data registers while the data in the cache registers are being read out. Host controller can retrieve continuous data and achieve fast read performance by iterating Cache Read operation. The Read Start for Last Page Cache Read command (3Fh) is used to complete data transfer from memory cells to data registers.

Read Operation with Cache Read

## Ready / $\overline{\text{Busy}}$

The device has a  $\overline{\text{R/B}}$  output that provides a hardware method of indicating the completion of a page program, erase and random read completion. The  $\overline{\text{R/B}}$  pin is normally high but transition to low after program or erase command is written to the command register or random read is started after address loading. It returns to high when the internal controller has finished the operation. The pin is an open-drain driver thereby allowing two or more  $\overline{\text{R/B}}$  outputs to be Or-tied. Because pull-up resistor value is related to  $t_r$  ( $\overline{\text{R/B}}$ ) and current drain during busy ( $i_{\text{busy}}$ ), an appropriate value can be obtained with the following reference chart. Its value can be determined by the following guidance.

### Ready/ $\overline{\text{Busy}}$ Pin Electrical Specifications

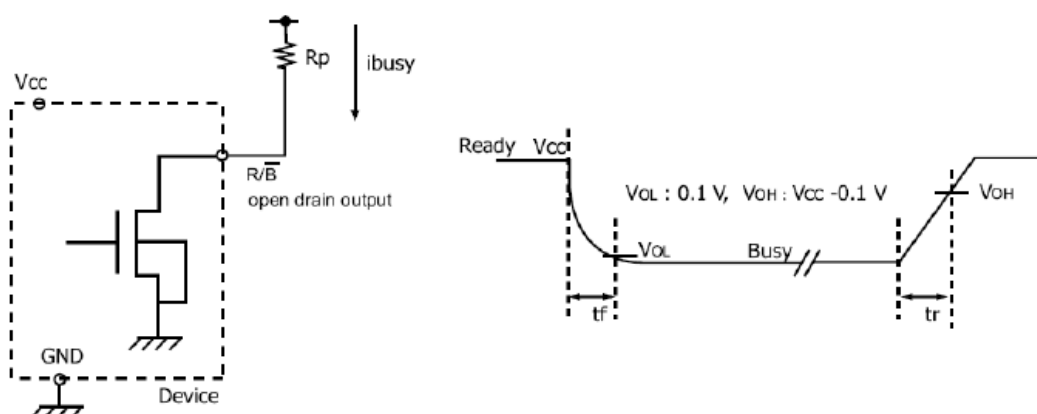

Fig.  $R_p$  vs  $t_r$ ,  $t_f$  &  $R_p$  vs  $i_{\text{busy}}$

@  $V_{CC} = 1.8 \text{ V}$ ,  $T_a = 25^\circ\text{C}$ ,  $C_L = 30 \text{ pF}$

#### $R_p$ value guidance

$$R_p (\text{min}) = \frac{V_{CC} (\text{Max.}) - V_{OL} (\text{Max.})}{I_{OL} + \sum I_L} = \frac{1.85 \text{ V}}{3 \text{ mA} + \sum I_L}$$

where  $I_L$  is the sum of the input currents of all devices tied to the  $\overline{\text{R/B}}$  pin.  
 $R_p(\text{max})$  is determined by maximum permissible limit of  $t_r$

## Data Protection & Power Up Sequence

The timing sequence shown in the figure below is necessary for the power-on/off sequence.

The device internal initialization starts after the power supply reaches an appropriate level in the power on sequence. During the initialization the device R/B signal indicates the Busy state as shown in the figure below. In this time period, the acceptable commands are 70h.

The  $\overline{WP}$  signal is useful for protecting against data corruption at power on/off.

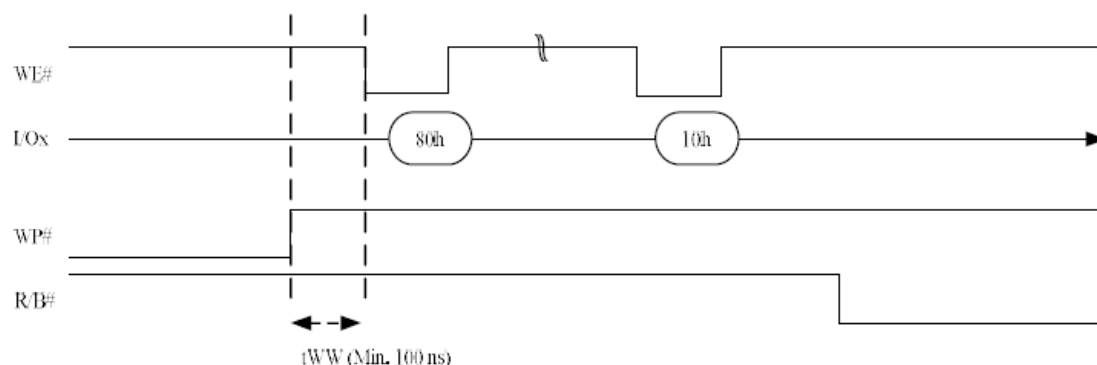

## AC Waveforms for Power Transition

## Write Protect Operation

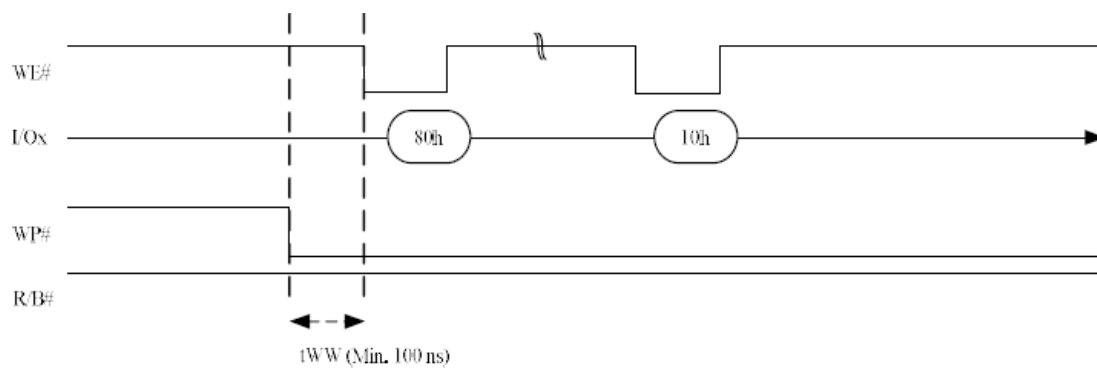

Enabling  $\overline{WP}$  during erase and program busy is prohibited. The erase and program operations are enabled and disabled as follows:

### Enable Programming

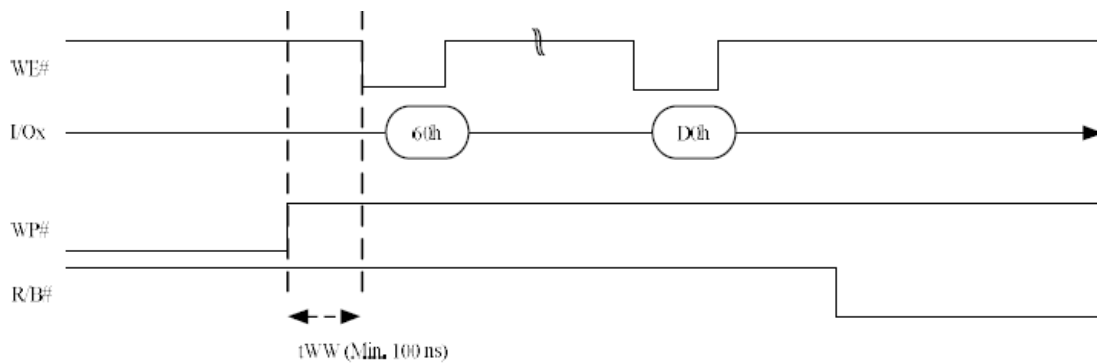

**NOTE:**  $\overline{WP}$  keeps "High" until programming finish.

### Disable Programming

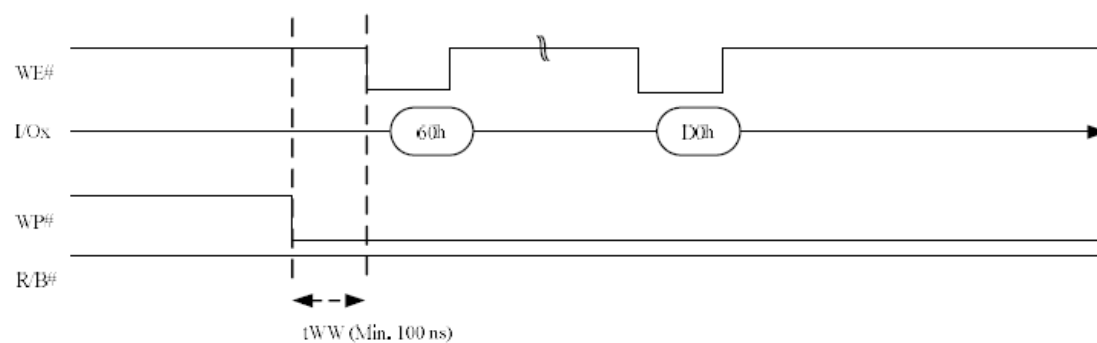

### Enable Erasing

**NOTE:**  $\overline{WP}$  keeps "High" until erasing finish.

### Disable Erasing

## One-Time Programmable (OTP) Operations

This flash device offers one-time programmable memory area. Thirty full pages of OTP data are available on the device, and the entire range is guaranteed to be good. The OTP area is accessible only through OTP commands.

The OTP area leaves the factory in an unwritten state. The OTP area cannot be erased, whether it is protected or not. Protecting the OTP area prevents further programming of that area.

The OTP area is only accessible while in OTP operation mode. To set the device to OTP operation mode, issue the Set Feature (EFh-90h-01h) command. When the device is in OTP operation mode, subsequent Read and/or Page Program are applied to the OTP area. When you want to come back to normal operation, you need to use EFh-90h-00h for OTP mode release. Otherwise, device will stay in OTP mode.

To program an OTP page, issue the Serial Data Input (80h) command followed by 4 address cycles. The first two address cycles are column address. For the third cycle, select a page in the range of 00h through 1Dh. The fourth cycle is fixed at 00h. Next, up to 1,056 words of data can be loaded into data register. The bytes other than those to be programmed do not need to be loaded. This device supports Random Data Input (85h) command, which can be operated multiple times in a page. The column address for the next data to be entered may be changed to the address follows the Random Data Input command. The Page Program confirm (10h) command initiates the programming process. The internal control logic automatically executes the programming algorithm, timing and verification. Please note that no partial-page program is allowed in the OTP area. In addition, the OTP pages must be programmed in the ascending order. A programmed OTP page will be automatically protected.

Similarly, to read data from an OTP page, set the device to OTP operation mode and then issue the Read (00h-30h) command. The device may output random data (not in sequential order) in a page by writing Random Data Output (05h-E0h) command, which can be operated multiple times in a page. The column address for the next data to be output may be changed to the address follows the Random Data Output command.

All pages in the OTP area will be protected simultaneously by issuing the Set Feature (EFh-90h-03h) command to set the device to OTP protection mode. After the OTP area is protected, no page in the area is programmable and the whole area cannot be unprotected.

The Read Status (70h) command is the only valid command for reading status in OTP operation mode.

### OTP Modes and Commands

	Set feature		Command
OTP Operation mode	Read	EFh-90h-01h	00h-30h
	Page Program	EFh-90h-01h	80h-10h
OTP Protection mode	Program Protect	EFh-90h-03h	80h-10h
OTP Release mode	Leave OTP mode	EFh-90h-00h	

### OTP Area Details

Description	Value
Number of OTP pages	30
OTP page address	01h – 1Eh
Number of partial page programs for each page in the OTP area	1

# Mobile DDR SDRAM Memory Operation

## ELECTRICAL SPECIFICATIONS

- All voltages are referenced to  $V_{SS}$  (GND).
- After power-up, wait more than 200  $\mu s$  and then, execute power on sequence and CBR (Auto) refresh before proper device operation is achieved.

### Absolute Maximum Rating

Parameter	Symbol	Rating	Unit
Voltage on any pin relative to $V_{SS}$	$V_T$	-0.5 to 2.3	V
Supply voltage relative to $V_{SS}$	$V_{DD}, V_{DDQ}$	-0.5 to 2.3	V
Short circuit output current	$I_{OS}$	50	mA
Power dissipation	$P_D$	1.0	W
Operating ambient temperature	$T_A$	-25 to +85	°C
Storage Temperature (plastic)	$T_{STG}$	-55 to +125	°C

#### Caution:

Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

### Recommended DC Operating Conditions

Recommended operating condition unless otherwise noted,  $V_{DD}/V_{DDQ} = 1.7\sim 1.95V$

Parameter	Pins	Symbol	Min.	Typ.	Max.	Unit	Note
Supply voltage		$V_{DD} / V_{DDQ}$	1.7	1.8	1.95	V	1
		$V_{SS} / V_{SSQ}$	0	0	0	V	
Input high voltage	All other input pins	$V_{IH}$	$0.8 \times V_{DDQ}$	-	$V_{DDQ} + 0.3$	V	
Input low voltage		$V_{IL}$	-0.3	-	$0.2 \times V_{DDQ}$	V	
DC input voltage	CK, CK#	$V_{IN}$	-0.3	-	$V_{DDQ} + 0.3$	V	
DC input differential voltage		$V_{ID}(DC)$	$0.4 \times V_{DDQ}$		$V_{DDQ} + 0.6$	V	5
AC input differential voltage		$V_{ID}(AC)$	$0.6 \times V_{DDQ}$		$V_{DDQ} + 0.6$	V	5
AC input differential cross point voltage		$V_{IX}$	$0.4 \times V_{DDQ}$	$0.5 \times V_{DDQ}$	$0.6 \times V_{DDQ}$	V	6
DC input high voltage	DQ, DM, DQS	$V_{IHD}(DC)$	$0.7 \times V_{DDQ}$		$V_{DDQ} + 0.3$	V	
DC input low voltage		$V_{ILD}(DC)$	-0.3		$0.3 \times V_{DDQ}$	V	
AC input high voltage		$V_{IHD}(AC)$	$0.8 \times V_{DDQ}$		$V_{DDQ} + 0.3$	V	
AC input low voltage		$V_{ILD}(AC)$	-0.3		$0.2 \times V_{DDQ}$	V	

#### Note:

1.  $V_{DDQ}$  must be equal to  $V_{DD}$ .
2.  $V_{IH}(\text{max.}) = 2.3V$  (pulse width  $\leq 5ns$ ).
3.  $V_{IL}(\text{min.}) = -0.5V$  (pulse width  $\leq 5ns$ ).
4. All voltage referred to  $V_{SS}$  and  $V_{SSQ}$  must be same potential.
5.  $V_{ID}(DC)$  and  $V_{ID}(AC)$  are the magnitude of the difference between the input level on CK and the input level on CK#.
6. The value of  $V_{IX}$  is expected to be  $0.5 \times V_{DDQ}$  and must track variations in the DC level of the same.

## DC Characteristics 1

Recommended operating condition unless otherwise noted,  $V_{DD}/V_{DDQ} = 1.7\sim 1.95V$

Parameter	Symbol	Max.	Unit	Test Condition	Note

Active Standby Current in power-down with clock stop	$I_{DD3PS}$	2	mA	One bank active, $CKE = \text{Low}$ , $CS\# = \text{High}$ , $CK = \text{Low}$ , $CK\# = \text{High}$ , address & control inputs are switching, data input signals are stable	
Active Standby Current in non power-down	$I_{DD3N}$	10	mA	One bank active, $CKE = \text{High}$ , $CS\# = \text{High}$ , $t_{CK} = t_{CK} \text{ (min)}$ , address & control inputs are switching, data input signals are stable	
Active Standby Current in non power-down with clock stop	$I_{DD3NS}$	7	mA	One bank active, $CKE = \text{High}$ , $CS\# = \text{High}$ , $CK = \text{Low}$ , $CK\# = \text{High}$ , address & control inputs are switching, data input signals are stable	
Operating Current (Burst Mode)	$I_{DD4}$	135	mA	One bank active, $BL=4$ , $CL=3$ , $t_{CK} = t_{CK} \text{ (min)}$ , $I_{OUT} = 0 \text{ mA}$ , continuous burst reads or writes, address inputs are switching, 50% data changing each burst	
Auto Refresh Current	$I_{DD5}$	80	mA	$CKE = \text{High}$ , $t_{CK} = t_{CK} \text{ (min)}$ , $t_{RFC} = t_{RFC} \text{ (min)}$ , address and control inputs are switching, data input signals are stable	
Deep Power-down Current	$I_{DD8}$	10	uA	Address and control pins are disable; data input signals are stable	

## Advanced Data Retention current ( $V_{DD}/V_{DDQ}=1.70\sim1.95V$ )

Parameter (Self Refresh Current)	Symbol	Max.	Unit	Condition	Note
PASR="000" (full)	$I_{DD6}$	250	$\mu A$	$-25^{\circ}C \sim +40^{\circ}C$ CKE=L	
PASR="001" (2BK)		220	$\mu A$		
PASR="010" (1BK)		200	$\mu A$		
PASR="000" (full)	$I_{DD6}$	480	$\mu A$	$+40^{\circ}C \sim +70^{\circ}C$ CKE=L	
PASR="001" (2BK)		350	$\mu A$		
PASR="010" (1BK)		280	$\mu A$		
PASR="000" (full)	$I_{DD6}$	600	$\mu A$	$+70^{\circ}C \sim +85^{\circ}C$ CKE=L	
PASR="001" (2BK)		400	$\mu A$		
PASR="010" (1BK)		300	$\mu A$		

### Note:

1. IDD specifications are tested after the device is properly initialized.
2. Input slew rate is specified by Test Conditions.
3. Definitions for  $I_{DD}$ :  
L is defined as  $V_{IN} \leq 0.1 \times V_{DDQ}$ ;  
H is defined as  $V_{IN} \geq 0.9 \times V_{DDQ}$ ;  
STABLE is defined as inputs stable at an H or L level;  
SWITCHING is defined as:  
Address and command: inputs changing between H and L once per two clock cycles;  
Data bus inputs: DQ changing between H and L once per clock cycle; DM and DQS are STABLE.

## DC Characteristics 2

Recommended operating condition unless otherwise noted,  $V_{DD}/V_{DDQ} = 1.7\sim1.95V$

Parameter	Symbol	Min	Max	Unit	Pins	Note
Input leakage current	$I_{LI}$	-2	2	$\mu A$	$0 \leq V_{IN} \leq V_{DDQ}$	
Output leakage current	$I_{LO}$	-1.5	1.5	$\mu A$	$0 \leq V_{OUT} \leq V_{DDQ}$ DQ = disable	
Output high voltage	$V_{OH}$	$0.9 \times V_{DDQ}$	-	V	$I_{OH} = -0.1mA$	
Output low voltage	$V_{OL}$	-	$0.1 \times V_{DDQ}$	V	$I_{OL} = 0.1mA$	

## Pin Capacitance

Parameter	Pins	Symbol	MIN	MAX	Unit	Notes
Input capacitance:	CK, CK#	$C_{I1}$	1.5	3.5	pF	1
	All other input-only pins	$C_{I2}$	1.5	3.0	pF	1
Delta Input capacitance	CK, CK#	$C_{DI1}$	-	0.25	pF	1
	All other input-only pins	$C_{DI2}$	-	0.5	pF	1
Data Input/output capacitance	DQs, DQS, DM	$C_{IO}$	2.0	4.5	pF	1, 2
Delta Input/output capacitance:	DQs, DQS, DM	$C_{DIO}$	-	0.5	pF	1

### Note:

1. These parameters are measured on conditions:  $f = 100MHz$ ,  $V_{OUT} = V_{DDQ}/2$ ,  $\Delta V_{OUT} = 0.2V$ ,  $T_A = +25^{\circ}C$ .
2.  $D_{OUT}$  circuits are disabled.

## AC Characteristics (Reference)

Recommended operating condition unless otherwise noted,  $V_{DD}/V_{DDQ} = 1.7\sim 1.95V$ ,  $T_A = -25$  to  $85^{\circ}C$

Parameter	Symbol	200MHz		Unit	Notes

Write to read command delay (to input all data)	$t_{WRD}$	$3+BL/2$	-	$t_{CK}$	
Burst stop command to write command delay (CL=3)	$t_{BSTW}$	3	-	$t_{CK}$	
Burst stop command to DQ high-Z (CL=3)	$t_{BSTZ}$	3	-	$t_{CK}$	
Read command to write command delay (to output all data) (CL=3)	$t_{RWD}$	$3+BL/2$	-	$t_{CK}$	
Precharge command to high-Z (CL=3)	$t_{HZP}$	3	-	$t_{CK}$	
Mode register set command cycle time	$t_{MRD}$	2	-	$t_{CK}$	

**Note:**

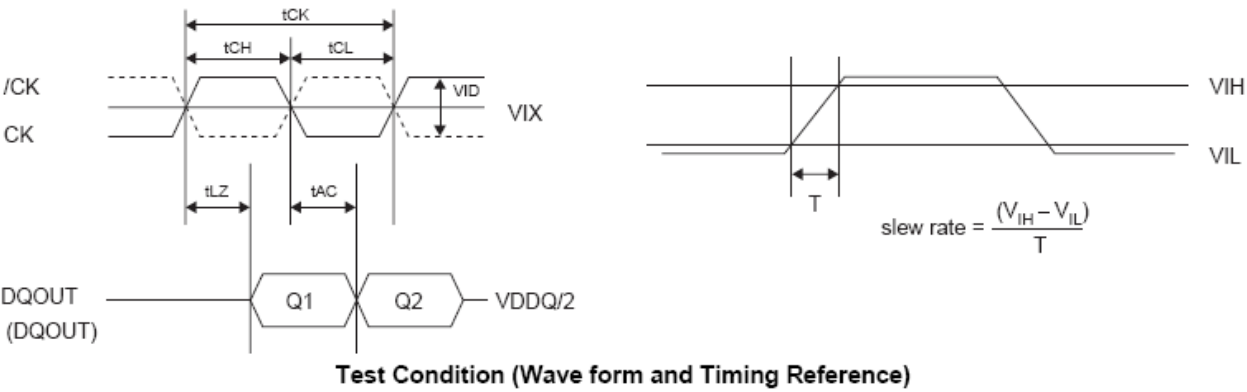

1. On all AC measurements, we assume the test conditions shown in “Test conditions” and full driver strength is assumed for the output load, that is both A6 and A5 of EMRS is set to be “L”.
2. This parameter defines the signal transition delay from the cross point of CK and CK#. The signal transition is defined to occur when the signal level crossing  $V_{DDQ}/2$ .
3. The timing reference level is  $V_{DDQ}/2$ .
4. Output valid window is defined to be the period between two successive transition of data out signals. The signal transition is defined to occur when the signal level crossing  $V_{DDQ}/2$ .
5.  $t_{HZ}$  is defined as  $D_{OUT}$  transition delay from low-Z to high-Z at the end of read burst operation. The timing reference is cross point of CK and CK#. This parameter is not referred to a specific  $D_{OUT}$  voltage level, but specify when the device output stops driving.
6.  $t_{LZ}$  is defined as  $D_{OUT}$  transition delay from high-Z to low-Z at the beginning of read operation. This parameter is not referred to a specific  $D_{OUT}$  voltage level, but specify when the device output begins driving.
7. The transition from low-Z to high-Z is defined to occur when the device output stops driving. A specific reference voltage to judge this transition is not given.
8.  $t_{AC}$ ,  $t_{DQSCK}$ ,  $t_{HZ}$  and  $t_{LZ}$  are specified with 15pF bus loading condition.
9. Minimum 3 clocks of  $t_{DAL}$  ( $= t_{WR} + t_{RP}$ ) is required because it need minimum 2 clocks for  $t_{WR}$  and minimum 1 clock for  $t_{RP}$ .  
 $t_{DAL} = (t_{WR}/t_{CK}) + (t_{RP}/t_{CK})$ : for each of the terms above, if not already an integer, round to the next higher integer.

Test Conditions

Parameter	Symbol	Value	Unit	Note
Input high voltage	$V_{IH} (AC)$	$0.8 \times V_{DDQ}$	V	1
Input low voltage	$V_{IL} (AC)$	$0.2 \times V_{DDQ}$	V	1
Input differential voltage, CK and CK# inputs	$V_{ID} (AC)$	1.4	V	1
Input differential cross point voltage, CK and CK# inputs	$V_{IX} (AC)$	$V_{DDQ}/2$ with $V_{DD}=V_{DDQ}$	V	
Input signal skew rate	SLEW	1	V/ ns	1
Output load	$C_L$	15	pF	

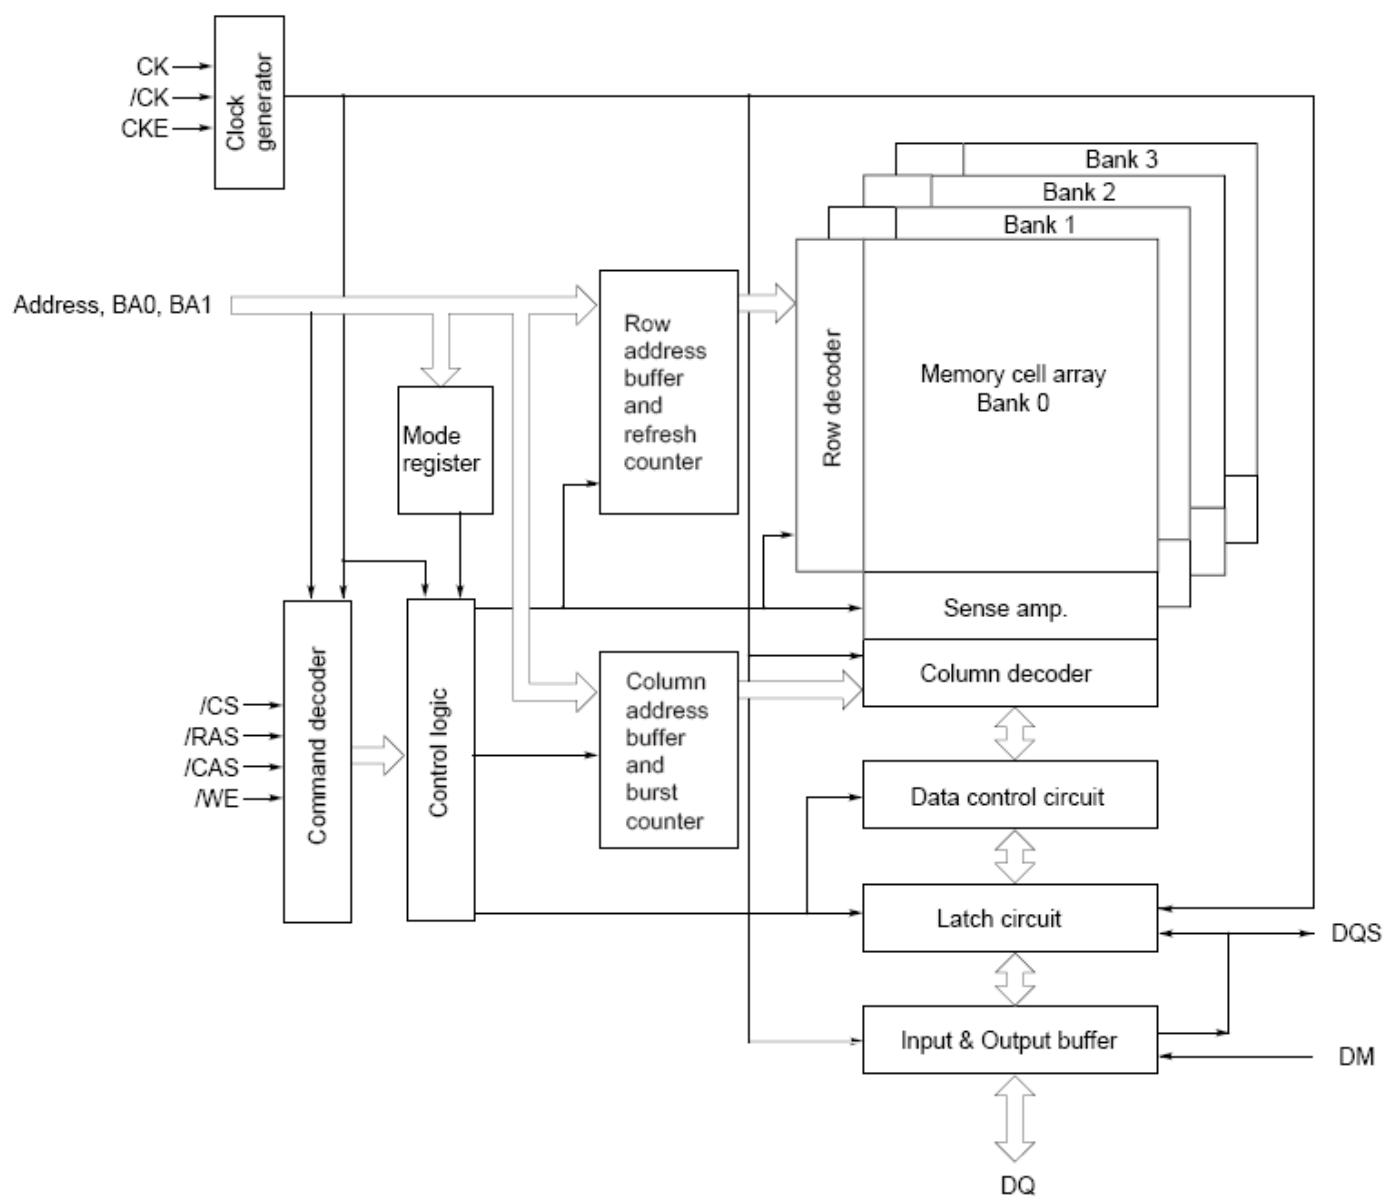

Note:

1.  $V_{DD}=V_{DDQ}$ .

Output Load

## Block Diagram

## PIN FUNCTION

### CK, CK# (input pins)

The CK and the CK# are the master clock inputs. All inputs except DMs, DQSs and DQs are referred to the cross point of the CK rising edge and the CK# falling edge. When a read operation, DQSs and DQs are referred to the cross point of the CK and the CK#. When a write operation, DMs and DQs are referred to the cross point of the DQS and the  $V_{DDQ}/2$  level. DQSs for write operation are referred to the cross point of the CK and the CK#. The other input signals are referred at CK rising edge.

### CS# (input pins)

When CS# is low, commands and data can be input. When CS# is high, all inputs are ignored. However, internal operations (bank active, burst operations, etc.) are held.

### RAS#, CAS#, and WE# (input pins)

These pins define operating commands (read, write, etc.) depending on the combinations of their voltage levels. See "Command operation".

### A0 to A12 (input pins)

Row address (AX0 to AX12) is determined by the A0 to the A12 level at the cross point of the CK rising edge and the CK# falling edge in a bank active command cycle. Column address is loaded at the cross point of the CK rising edge and the CK# falling edge in a read or a write command cycle (See "Address Pins Table"). This column address becomes the starting address of a burst operation

Address Pins Table

Page size	Organization	Row address	Column address
2KB	x 16 bits	AX0 to AX12	AY0 to AY9

### A10 (AP) (input pin)

A10 defines the precharge mode when a precharge command, a read command or a write command is issued. If A10 = high when a precharge command is issued, all banks are precharged. If A10 = low when a precharge command is issued, only the bank that is selected by BA1/BA0 is precharged. If A10 = high when read or write command, auto precharge function is enabled.

### BA0 and BA1 (input pins)

BA0 and BA1 are bank select signals (BA). The memory array is divided into bank 0, bank 1, bank 2 and bank 3. (See Bank Select Signal Table)

Bank Select Signal Table

	BA0	BA1
Bank 0	L	L
Bank 1	H	L
Bank 2	L	H
Bank 3	H	H

Remark: H:  $V_{IH}$  and L:  $V_{IL}$

### CKE (input pin)

CKE controls power-down mode, self-refresh function and deep power-down function with other command inputs. The CKE level must be kept for 2 clocks at least, that is, if CKE changes at the cross point of the CK rising edge and the CK# falling edge with proper setup time  $t_{IS}$ , by the next CK rising edge CKE level must be kept with proper hold time  $t_{IH}$ .

### DQ0 to DQ15 (input/Output pins)

Data are input to and output from these pins.

### UDQS and LDQS (input and output pins)

DQS provides the read data strobes (as output) and the write data strobes (as input). Each DQS pin corresponds to eight DQ pins, respectively (See DQS and DM Correspondence Table).

### UDM and LDM (input pins)

DM is the reference signals of the data input mask function. DM is sampled at the cross point of DQS and  $V_{DDQ}/2$ . When DM = high, the data input at the same timing are masked while the internal burst counter will be counting up. Each DM pin corresponds to eight DQ pins, respectively (See DQS and DM Correspondence Table).

**DQS and DM Correspondence Table**

Organization	DQS	Data mask	DQs
X16 bits	LDQS	LDM	DQ0 to DQ7
	UDQS	UDM	DQ8 to DQ15

### $V_{DD}$ , $V_{SS}$ , $V_{DDQ}$ and $V_{SSQ}$ (power supply)

$V_{DD}$  and  $V_{SS}$  are power supply pins for internal circuits.  $V_{DDQ}$  and  $V_{SSQ}$  are power supply pins for the output buffers.  $V_{DD}$  must be equal to  $V_{DDQ}$ .

# COMMAND OPERATIONS

## Command Truth Table

Name (Function)	Symbol	CKE		CS#	RAS#	CAS#	WE#	BA1	BA0	AP	ADDR
		n-1	n								
Ignore command	DESL	H	H	H	X	X	X	X	X	X	X
No operation	NOP	H	H	L	H	H	H	X	X	X	X
Burst stop command	BST	H	H	L	H	H	L	X	X	X	X
Column address and read command	READ	H	H	L	H	L	H	V	V	L	V
Read with auto precharge	READA	H	H	L	H	L	H	V	V	H	V
Column address and write command	WRIT	H	H	L	H	L	L	V	V	L	V
Write with auto precharge	WRITA	H	H	L	H	L	L	V	V	H	V
Row address strobe and bank active	ACT	H	H	L	L	H	H	V	V	V	V
Precharge selected bank	PRE	H	H	L	L	H	L	V	V	L	X
Precharge all banks	PALL	H	H	L	L	H	L	X	X	H	X
Refresh	REF	H	H	L	L	L	H	X	X	X	X
	SELF	H	L	L	L	L	H	X	X	X	X
Mode register set	MRS	H	H	L	L	L	L	L	L	L	V
	EMRS	H	H	L	L	L	L	H	L	L	V

Remark: H:  $V_{IH}$ , L:  $V_{IL}$ , X: Don't care, and V: Valid address input

### Notes:

- The CKE level must be kept for 1 CK cycle at least.

### Ignore command [DESL]

When CS# is high at the cross point of the CK rising edge and the CK# falling edge, all input signals are neglected and internal state is held.

### No operation [NOP]

As long as this command is input at the cross point of the CK rising edge and the CK# falling edge, address and data input are neglected and internal state is held.

### Burst stop command [BST]

This command stops a current burst operation.

### Column address strobe and read command [READ]

This command starts a read operation. The start address of the burst read is determined by the column address (See "Address Pins Table" in Pin Function) and the bank select address. After the completion of the read operation, all output buffers become high-Z.

### Read with auto precharge [READA]

This command starts a read operation. After completion of the read operation, precharge is automatically executed.

### **Column address strobe and write command [WRIT]**

This command starts a write operation. The start address of the burst write is determined by the column address (See "Address Pins Table" in Pin Function) and the bank select address.

### **Write with auto precharge [WRITA]**

This command starts a write operation. After completion of the write operation, precharge is automatically executed.

### **Row address strobe and bank activate [ACT]**

This command activates the bank that is selected by BA0 and BA1 (See Bank Select Signal Table) and determines the row address (Address Pins Table in "Pin Function").

### **Precharge selected bank [PRE]**

This command starts precharge operation for the bank selected by BA0 and BA1. (See Bank Select Signal Table)

### **Precharge all banks [PALL]**

This command starts a precharge operation for all banks.

### **Refresh [REF/SELF]**

This command starts a refresh operation. There are two types of refresh operation, one is auto-refresh, and another is self-refresh. For details, refer to the CKE truth table section.

### **Mode register set/Extended mode register set [MRS/EMRS]**

The DDR Mobile RAM has the two mode registers, the mode register and the extended mode register, to define how it works. The both mode registers are set through the address pins in the mode register set cycle. For details, refer to "Mode register and extended mode register set".

## Function Truth Table

The following tables show the operations that are performed when each command is issued in each state of the DDR Mobile RAM.

Current state	CS#	RAS#	CAS#	WE#	Address	Command	Operation
Precharging <sup>*1</sup>	H	X	X	X	X	DESL	NOP

Remark: H: V<sub>IH</sub>, L: V<sub>IL</sub>, and X: Don't care

#### Notes:

1. The DDR Mobile RAM is in "Precharging" state for t<sub>RP</sub> after precharge command is issued.
2. The DDR Mobile RAM reaches "IDLE" state t<sub>RP</sub> after precharge command is issued.
3. The DDR Mobile RAM is in "Refresh" state for t<sub>REF</sub> after auto-refresh command is issued.
4. The DDR Mobile RAM is in "Activating" state for t<sub>RCD</sub> after ACT command is issued.
5. The DDR Mobile RAM is in "Active" state after "Activating" is completed.
6. The DDR Mobile RAM is in "READ" state until burst data have been output and DQ output circuits are turned off.
7. The DDR Mobile RAM is in "READ with auto precharge" from READA command until burst data has been output and DQ output circuits are turned off.
8. The DDR Mobile RAM is in "WRITE" state from WRIT command to the last burst data are input.
9. The DDR Mobile RAM is in "Write recovering" for t<sub>WR</sub> after the last data are input.
10. The DDR Mobile RAM is in "Write with auto precharge" until t<sub>WR</sub> after the last data has been input.
11. This command may be issued for other banks, depending on the state of the banks.
12. Not bank-specific; requires that all banks are idle and no bursts are in progress.
13. Before executing a write command to stop the preceding burst read operation, BST command must be issued. All states and sequences not shown are reserved and/or illegal.

## CKE Truth Table

Current state	Command	CKE		CS#	RAS#	CAS#	WE#	Address	Notes
		n-1	n						
Idle	Auto-refresh command (REF)	H	H	L	L	L	H	X	2
Idle	Self-refresh entry (SELF)	H	L	L	L	L	H	X	2
Active/Idle	Power-down entry (PDEN)	H	L	L	H	H	H	X	2
		H	L	H	X	X	X	X	
Idle	Deep power-down entry (DPDEN)	H	L	L	H	H	L	X	
Self-refresh	Self-refresh exit (SELFX)	L	H	L	H	H	H	X	
		L	H	H	X	X	X	X	
Power-down	Power-down exit (PDEX)	L	H	L	H	H	H	X	
		L	H	H	X	X	X	X	
Deep power-down	Power-down exit (DPDEX)	L	H	X	X	X	X	X	

### Notes:

1. H:  $V_{IH}$ . L:  $V_{IL}$ . X: Don't care.
2. All the banks must be in IDLE and no bursts in progress before executing this command.
3. The CKE level must be kept for 1 clock cycle at least.

### Auto-refresh command [REF]

This command executes auto-refresh. The bank and the ROW addresses to be refreshed are internally determined by the internal refresh controller. The output buffer becomes high-Z after auto-refresh start. Precharge has been completed automatically after the auto-refresh. The ACT or MRS command can be issued  $t_{RFC}$  after the last auto-refresh command.

The average refresh interval is 7.8 $\mu$ s. To allow for improved efficiency in scheduling, some flexibility in the absolute refresh interval is provided. A maximum of eight auto-refresh commands can be posted to the DDR Mobile RAM or the maximum absolute interval between any auto-refresh command and the next auto-refresh command is  $8 \times t_{REFI}$ .

### Self-refresh entry [SELF]

This command starts self-refresh. The self-refresh operation continues as long as CKE is held low. During the self-refresh operation, all ROW addresses are repeated refreshing by the internal refresh controller. A self-refresh is terminated by a self-refresh exit command.

### Power-down mode entry [PDEN]

$t_{PDEN}$  (= 2 clocks) after the cycle when [PDEN] is issued, the DDR Mobile RAM enters into power-down mode. In power-down mode, power consumption is suppressed by deactivating the input initial circuit. Power-down mode continues while CKE is held low. No internal refresh operation occurs during the power-down mode.

### Deep power-down mode entry [DPDEN]

After the command execution, deep power-down mode continues while CKE remains low. Before executing deep power-down, all banks must be precharged or in idle state.

### Self-refresh exit [SELFX]

This command is executed to exit from self-refresh mode.  $t_{SREX}$  after [SELFX], the device will be into idle state.

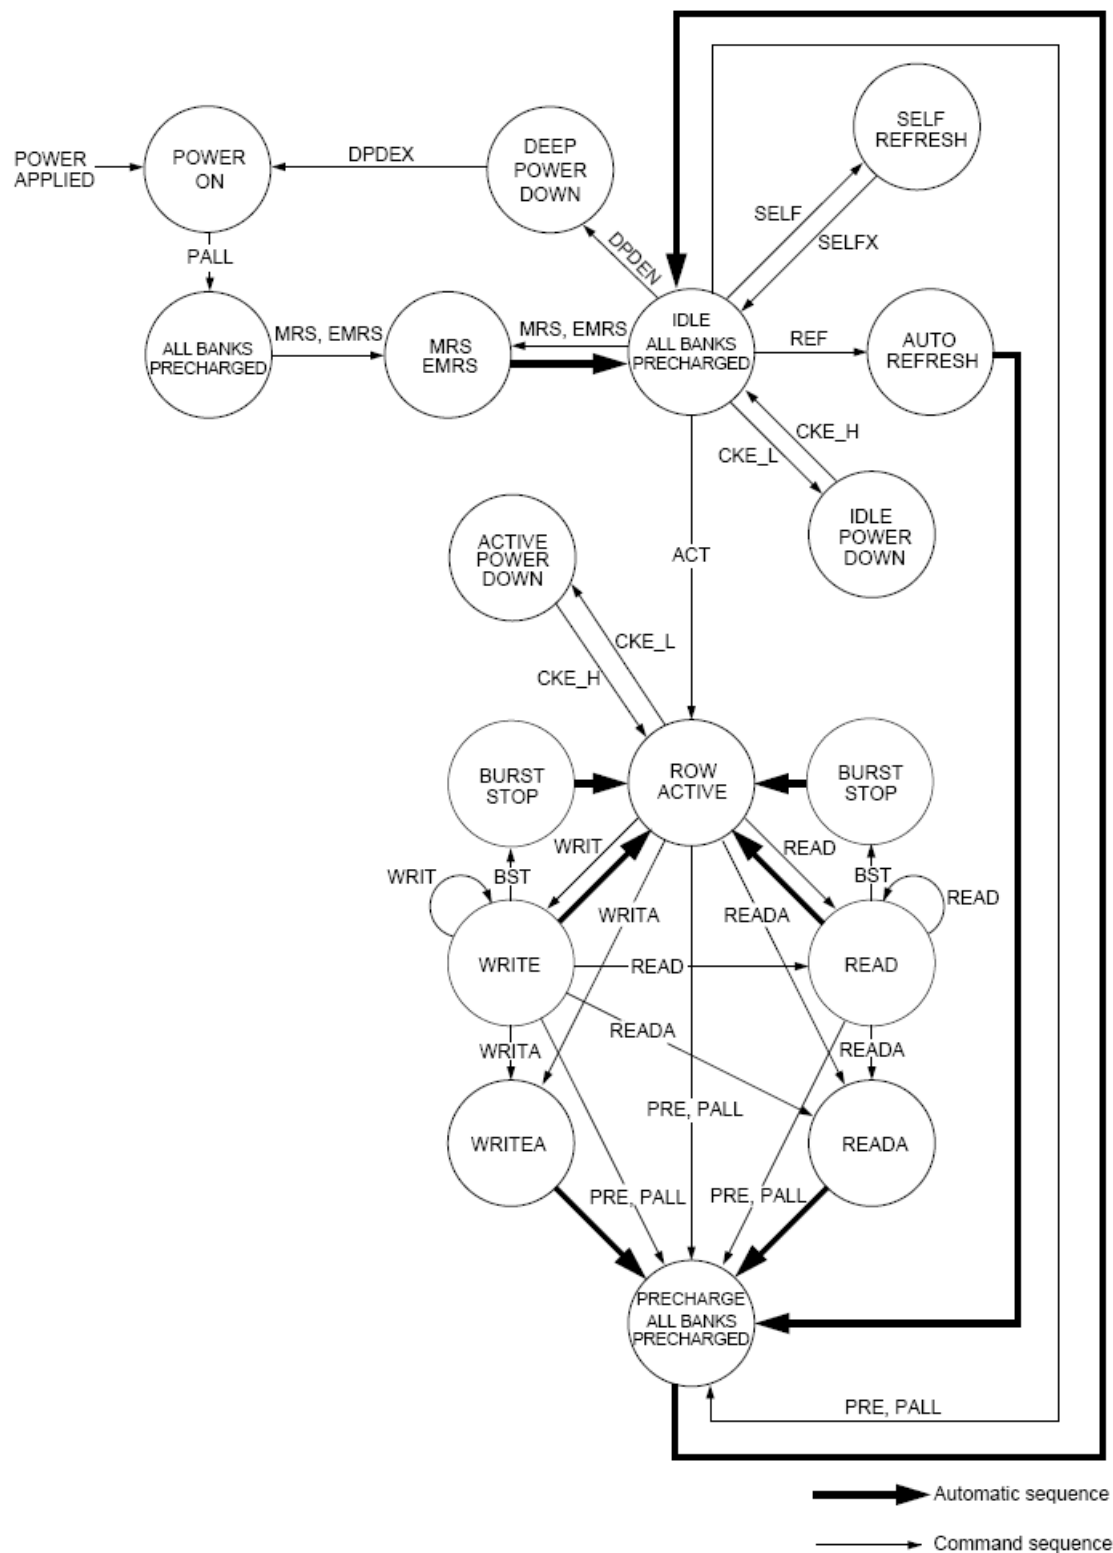

### Power-down mode exit [PDEX]

The DDR Mobile RAM can exit from power-down mode  $t_{PDEX}$  (1 cycle min.) after the cycle when [PDEX] is issued.

### Deep power-down mode exit [DPDEX]

As CKE goes high in the deep power-down mode, the DDR Mobile RAM exits from the deep power-down mode through deep power-down exiting sequence.

SIMPLIFIED STATE DIAGRAM

# Operation of the DDR Mobile RAM

## Initialization

The DDR Mobile RAM is initialized in the power-on sequence according to the following.

1. Provide power, the device core power ( $V_{DD}$ ) and the device I/O power ( $V_{DDQ}$ ) must be brought up simultaneously to prevent device latch-up. Although not required, it is recommended that  $V_{DD}$  and  $V_{DDQ}$  are from the same power source. Also assert and hold Clock Enable (CKE) to a LV-CMOS logic high level.
2. Once the system has established consistent device power and CKE is driven high, it is safe to apply stable clock.
3. There must be at least 200 $\mu$ s of valid clocks before any command may be given to the DRAM. During this time NOP or deselect (DESL) commands must be issued on the command bus.
4. Issue a precharge all command.
5. Provide NOPs or DESL commands for at least  $t_{RP}$  time.
6. Issue an auto-refresh command followed by NOPs or DESL command for at least  $t_{RFC}$  time. Issue the second auto-refresh command followed by NOPs or DESL command for at least  $t_{RFC}$  time. Note as part of the initialization sequence there must be two auto-refresh commands issued. The typical flow is to issue them at Step 6, but they may also be issued between steps 10 and 11.
7. Using the MRS command, load the base mode register. Set the desired operating modes.
8. Provide NOPs or DESL commands for at least  $t_{MRD}$  time.
9. Using the MRS command, program the extended mode register for the desired operating modes.
10. Provide NOP or DESL commands for at least  $t_{MRD}$  time.
11. The DRAM has been properly initialized and is ready for any valid command.

## Mode Register and Extended Mode Register Set

There are two mode registers, the mode register and the extended mode register so as to define the operating mode. Parameters are set to both through the A0 to the A12 and BA0 and BA1 pins by the mode register set command [MRS] or the extended mode register set command [EMRS]. The mode register and the extended mode register are set by inputting signal via the A0 to the A12 and BA0 and BA1 pins during mode register set cycles. BA0 and BA1 determine which one of the mode register or the extended mode register are set. Prior to a read or a write operation, the mode register must be set.

### Mode register

The mode register has four fields;

Reserved	: A12 through A7
CAS# latency	: A6 through A4
Wrap type	: A3
Burst length	: A2 through A0

Following mode register programming, no command can be issued before at least 2 clocks have elapsed.

### CAS# Latency

CAS# latency must be set to 3

### Burst length

Burst Length is the number of words that will be output or input in a read or write cycle. After a read burst is completed, the output bus will become high-Z. The burst length is programmable as 2, 4, 8 and 16.

### Wrap type (Burst sequence)

The wrap type specifies the order in which the burst data will be addressed. This order is programmable as either "Sequential" or "Interleave". "Burst Operation" shows the addressing sequence for each burst length for each wrap type.

## Extended mode register

The extended mode register has three fields;

Reserved	: A12 through A7, A4, A3
Driver Strength	: A6 through A5
Partial Array Self-Refresh	: A2 through A0

Following extended mode register programming, no command can be issued before at least 2 clocks have elapsed.

## Driver strength

By setting specific parameter on A6 and A5, driving capability of data output drivers is selected.

## Auto Temperature Compensated Self-Refresh (ATCSR)

The DDR Mobile RAM automatically changes the self-refresh cycle by on die temperature sensor. No extended mode register program is required. Manual TCSR (Temperature Compensated Self-Refresh) is not implemented.

## Partial Array Self-Refresh

Memory array size to be refreshed during self-refresh operation is programmable in order to reduce power. Data outside the defined area will not be retained during self-refresh.

## Deep Power-Down Exit Sequence

In order to exit from the deep power-down mode and enter into the idle mode, the following sequence is needed, which is similar to the power-on sequence.

- (1) A 200 $\mu$ s or longer pause must precede any command other than ignore command (DESL).
- (2) After the pause, all banks must be precharged using the precharge command (the precharge all banks command is convenient).
- (3) Once the precharge is completed and the minimum  $t_{RP}$  is satisfied, two or more Auto-refresh must be performed.
- (4) Both the mode register and the extended mode register must be programmed. After the mode register set cycle or the extended mode register set cycle,  $t_{MRD}$  (2 clocks minimum) pause must be satisfied.

Remarks:

1. The sequence of Auto-refresh, mode register programming and extended mode register programming above may be transposed.
2. CKE must be held high.

## Power-Down Mode and CKE Control

DDR Mobile RAM will be into power-down mode at the second CK rising edge after CKE to be low level with NOP or DESL command at first CK rising edge after CKE signal to be low.

Notes:

1. Valid\*1 can be either Activate command or Precharge command, When Valid\*1 is Activate command, power-down mode will be active power-down mode, while it will be precharge power down mode, if Valid\*1 will be Precharge command.
2. Valid\*2 can be any command as long as all of specified AC parameters are satisfied.

## Power-Down Entry and Exit

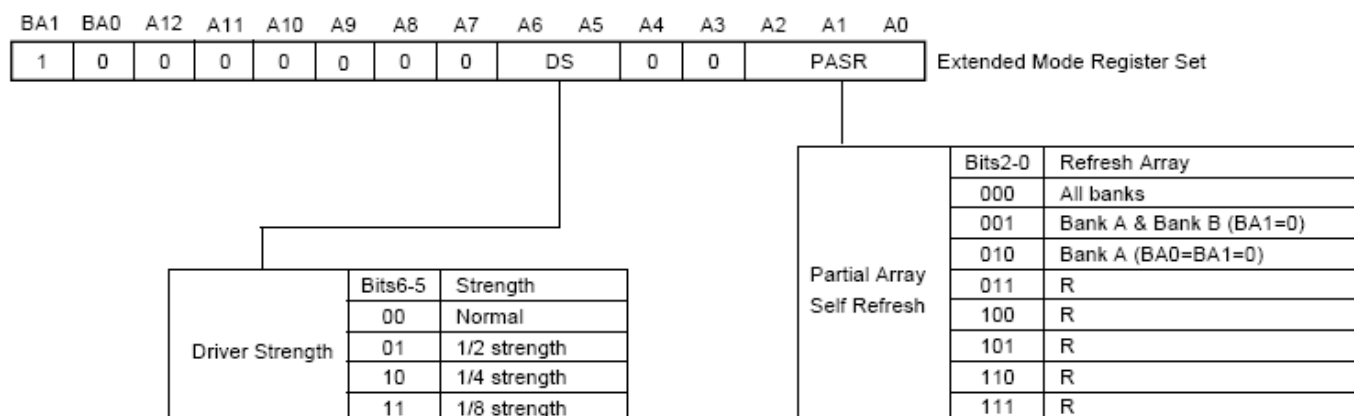

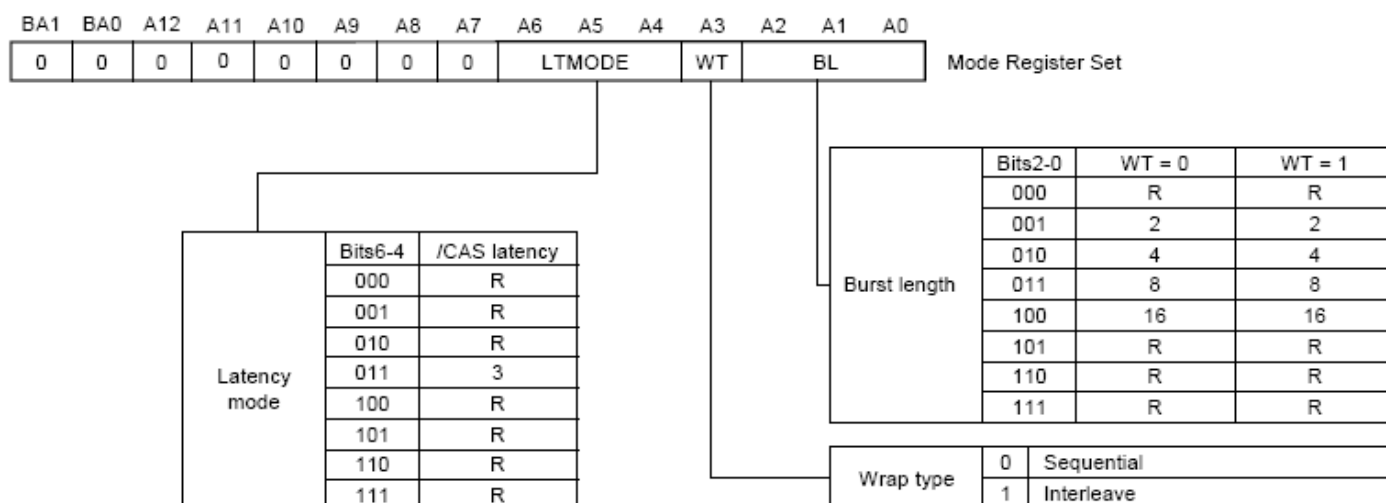

However, if the CKE has one clock cycle high and on clock cycle low just as below, even DDR Mobile RAM will not enter power-down mode, this command flow does not hurt any data and can be done.

Note: Assume PRE and ACT command is closing and activating same bank.

### CKE Control

### Mode Register Definition

**Remark:** R: Reserved

## Burst Operation

The burst type (BT) and the first three bits of the column address determine the order of a data out.

Burst Length	Starting Column Address (A3, A2,A1,A0)	Burst type = Sequential A3 = 0	Burst type = Interleaved A3 = 1
2	0000	0,1	0,1
	0001	1,0	1,0
4	0000	0,1,2,3	0,1,2,3
	0001	1,2,3,0	1,0,3,2
	0010	2,3,0,1	2,3,0,1
	0011	3,0,1,2	3,2,1,0

## Read/Write Operations

### Bank Active

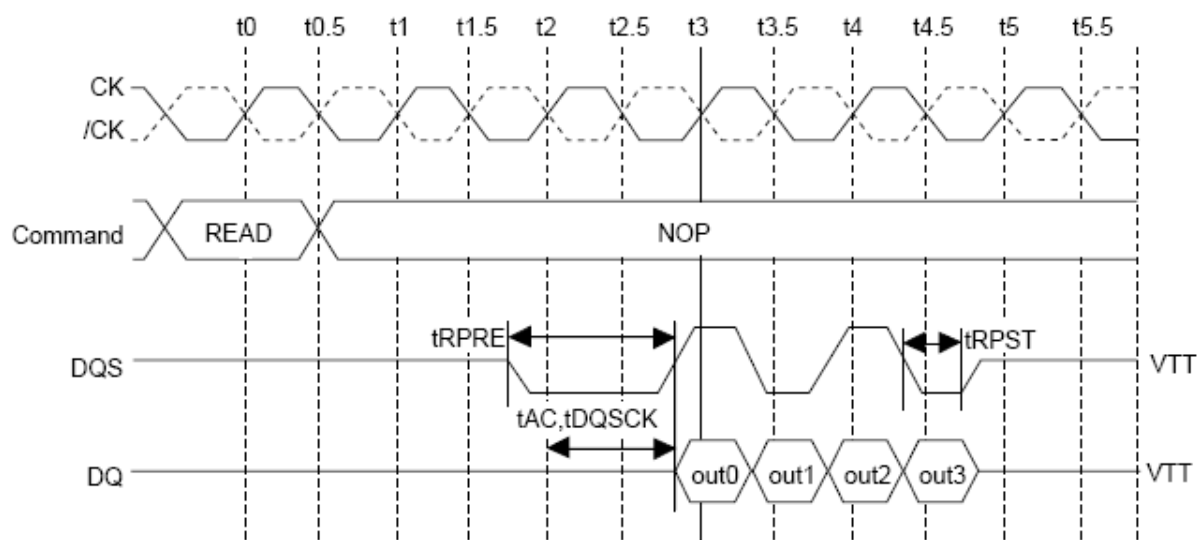

A read or a write operation begins with the bank active command [ACT]. The bank active command determines a bank address and a row address. For the bank and the row, a read or a write command can be issued  $t_{RCD}$  after the ACT is issued.

### Read operation

The burst length (BL), the /CAS latency (CL) and the burst type (BT) of the mode register are referred when a read command is issued. The burst length (BL) determines the length of a sequential output data by the read command that can be set to 2, 4, 8 or 16. The starting address of the burst read is defined by the column address, the bank select address (See "Pin Function") in the cycle when the read command is issued. The data output timing is characterized by CL and  $t_{AC}$ . The read burst start  $(CL-1) \times t_{CK} + t_{AC}$  (ns) after the clock rising edge where the read command is latched. The DDR Mobile RAM outputs the data strobe through DQS pins simultaneously with data.  $t_{RPRE}$  prior to the first rising edge of the data strobe, the DQS pins are driven low from high-Z state. This low period of DQS is referred as read preamble. The burst data are output coincidentally at both the rising and falling edge of the data strobe. The DQ pins become high-Z in the next cycle after the burst read operation completed.  $t_{RPST}$  from the last falling edge of the data strobe, the DQS pins become high-Z. This low period of DQS is referred as read postamble.

Read Operation (Burst Length)

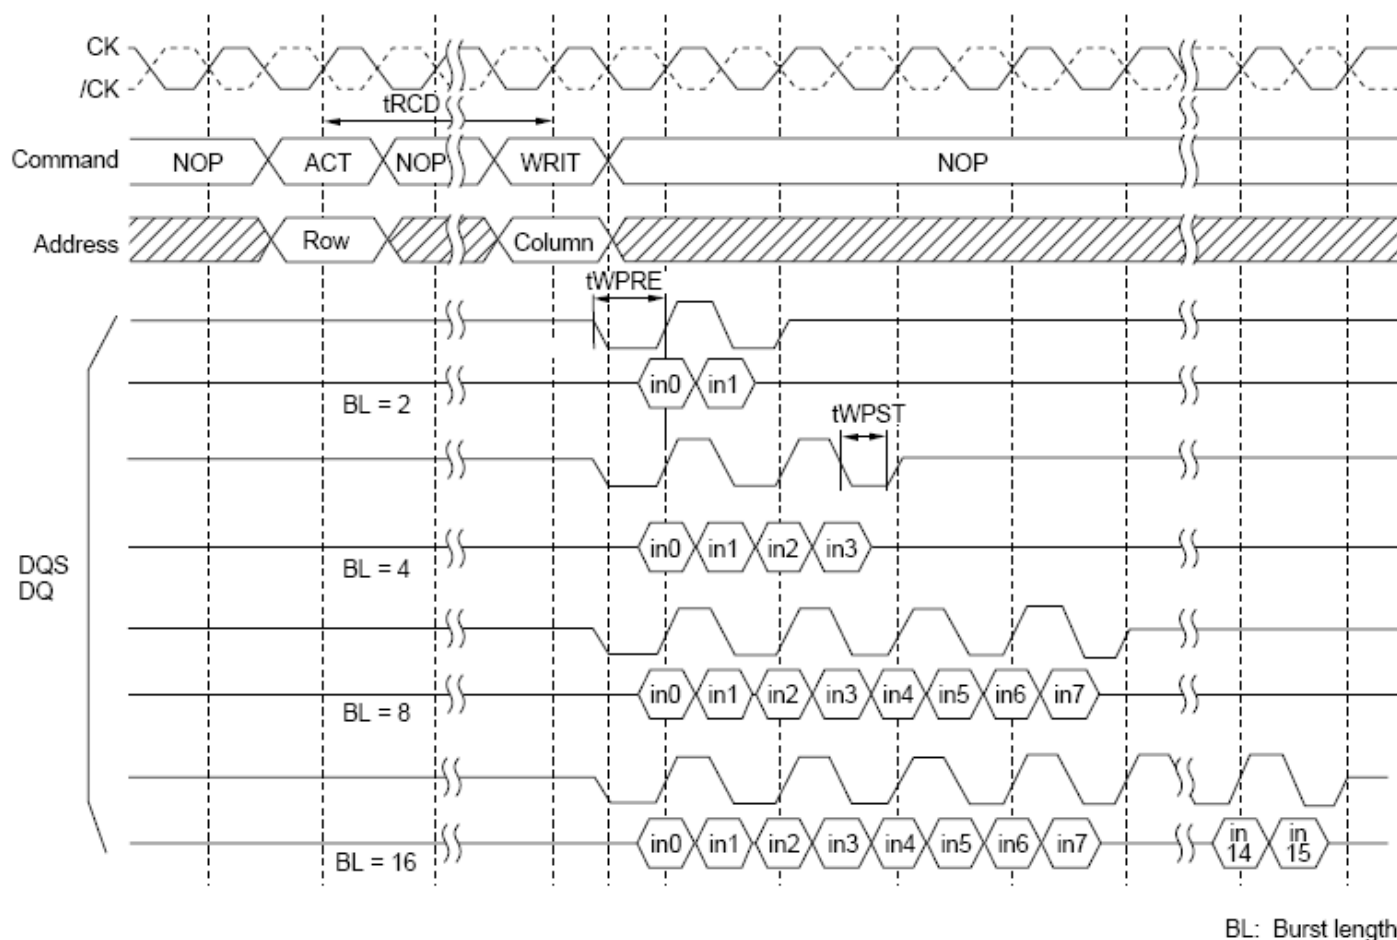

Read Operation (CAS# Latency)

## Write Operation

The burst length (BL) and the burst type (BT) of the mode register are referred when a write command is issued. The burst length (BL) determines the length of a sequential data input by the write command that can be set to 2, 4, 8 or 16. The latency from write command to data input is fixed to 1. The starting address of the burst write is defined by the column address, the bank select address (See "Pin Function") in the cycle when the write command is issued. DQS should be input as the strobe for the input-data and DM as well during burst operation.  $t_{WPRE}$  prior to the first rising edge of DQS, DQS must be set to low.  $t_{WPST}$  after the last falling edge of DQS, the DQS pins can be changed to high-Z. The leading low period of DQS is referred as write preamble. The last low period of DQS is referred as write postamble.

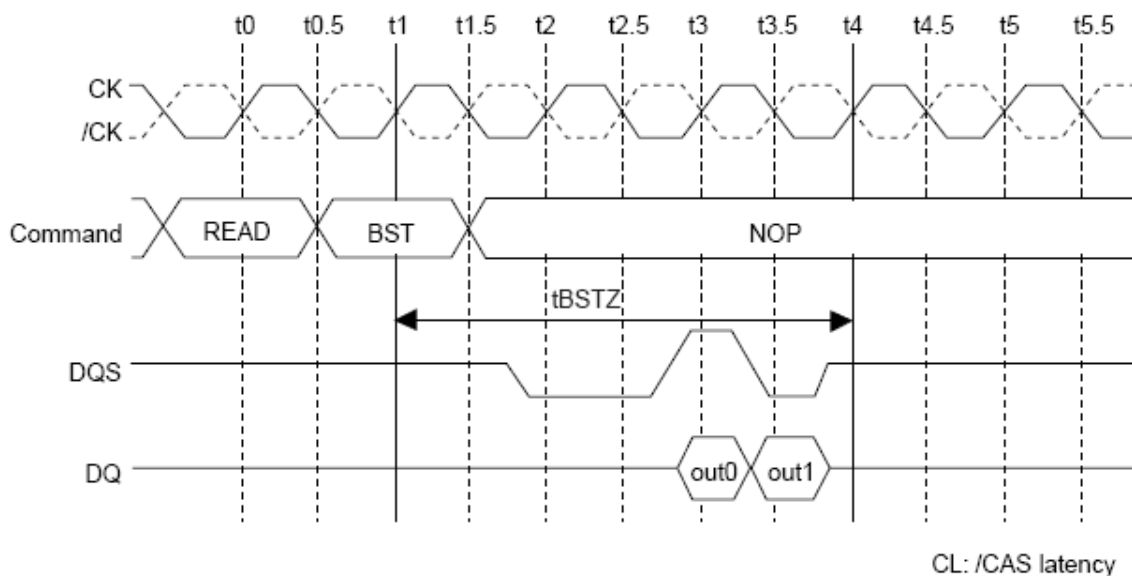

## Write Operation

## Burst Stop

### Burst stop command during burst operation

The burst stop (BST) command stops the burst read and sets all output buffers to high-Z.  $t_{BSTZ}$  ( $= CL$ ) cycles after a BST command issued, all DQ and DQS pins become high-Z. The BST command is also supported for the burst write operation. No data will be written in subsequent cycles. Note that bank address is not referred when this command is executed.

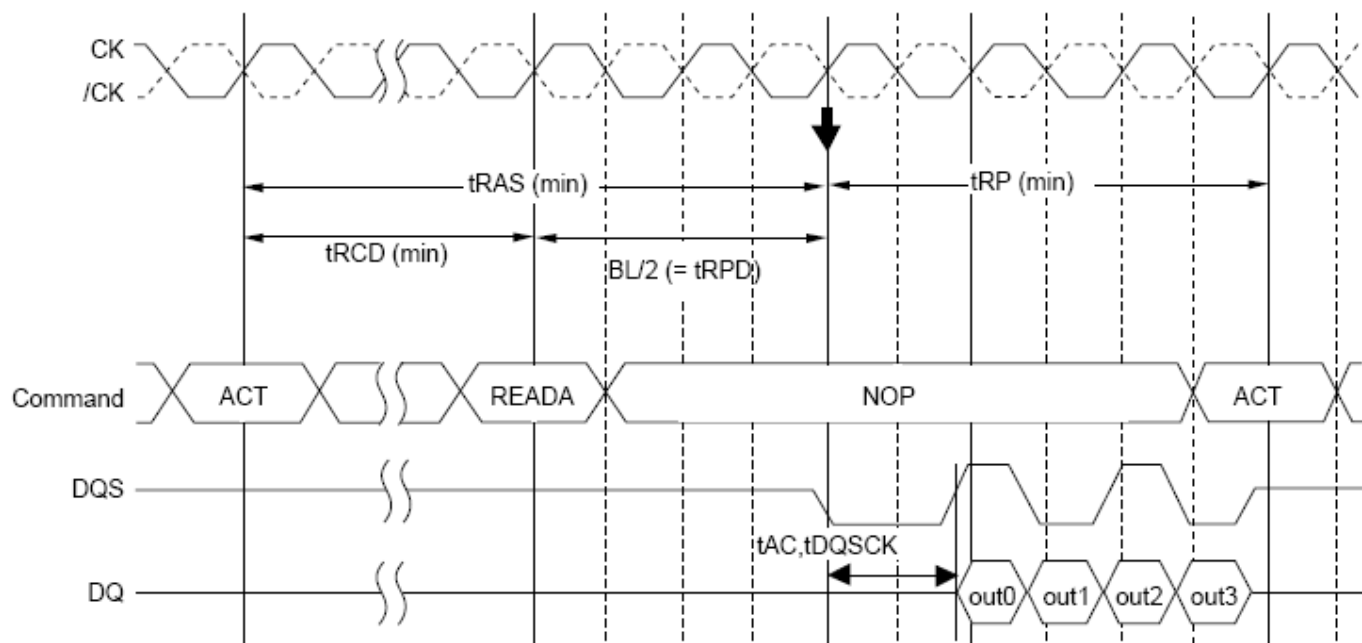

Burst Stop during a Read Operation

## Auto Precharge

### Read with auto precharge

The precharge is automatically performed after completing a read operation. The precharge starts  $BL/2 (= t_{RPD})$  clocks after READA command input.  $t_{RAS}$  lock out mechanism for READA allows a read command with auto precharge to be issued to a bank that has been activated (opened) but has not yet satisfied the  $t_{RAS}$  (min) specification. A column command to the other active bank can be issued the next cycle after the last data output. Read with auto precharge command does not limit row commands execution for other bank.

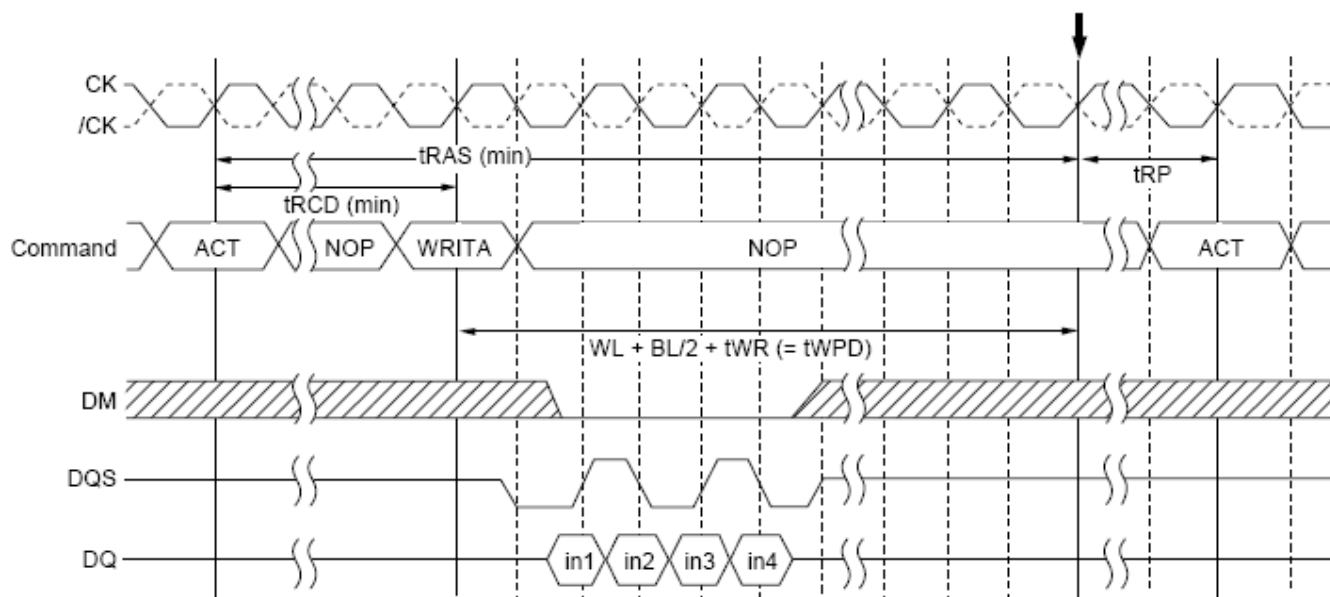

Note: Internal auto-precharge starts at the timing indicated by "↓".

### Read with auto precharge

## Write with auto precharge

The precharge is automatically performed after completing a burst write operation. The precharge operation is started Write latency ( $WL$ ) +  $BL/2$  +  $t_{WR}$  ( $= t_{WPD}$ ) clocks after  $WRITA$  command issued.

A column command to the other banks can be issued the next cycle after the internal precharge.

Note: Internal auto-precharge starts at the timing indicated by "↓".

BL = 4

Burst Write (BL=4)

## The Concurrent Auto Precharge

The DDR Mobile RAM supports the concurrent auto precharge feature, a read with auto precharge or a write with auto precharge, can be followed by any command to the other banks, as long as that command does not interrupt the read or write data transfer, and all other related limitations apply (e.g. contention between READ data and WRITE data must be avoided.) The minimum delay from a read or write command with auto precharge, to a command to a different bank, is summarized below.

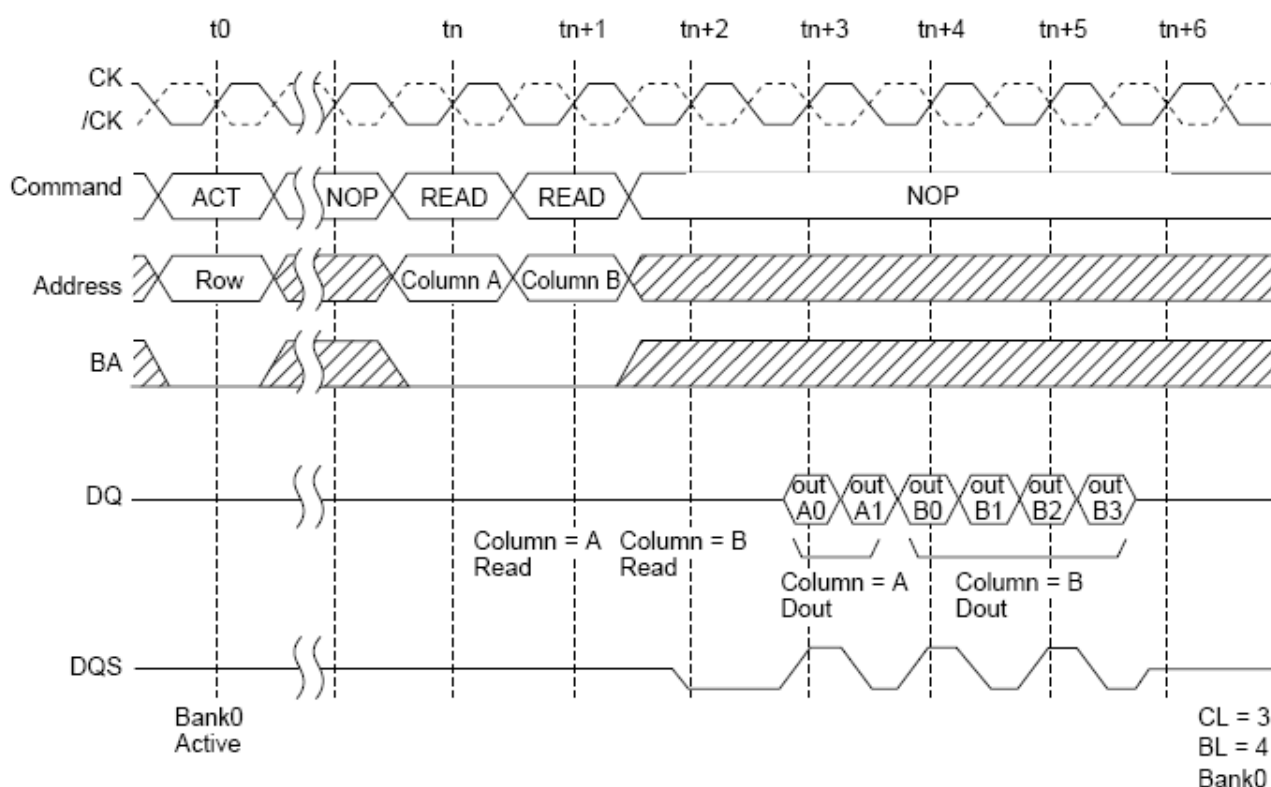

From command	To command (different bank, non-interrupting command)	Minimum delay (Concurrent AP supported)	Units
Read w/ AP	Read or Read w/ AP	$BL/2$	$t_{CK}$
	Write or Write w/ AP	$CL$ (round up) + $(BL/2)$	$t_{CK}$
	Precharge or Activate	1	$t_{CK}$
Write w/ AP	Read or Read w/ AP	$1 + (BL/2) + t_{WTR}$	$t_{CK}$
	Write or Write w/ AP	$BL/2$	$t_{CK}$
	Precharge or Activate	1	$t_{CK}$

## Command Intervals

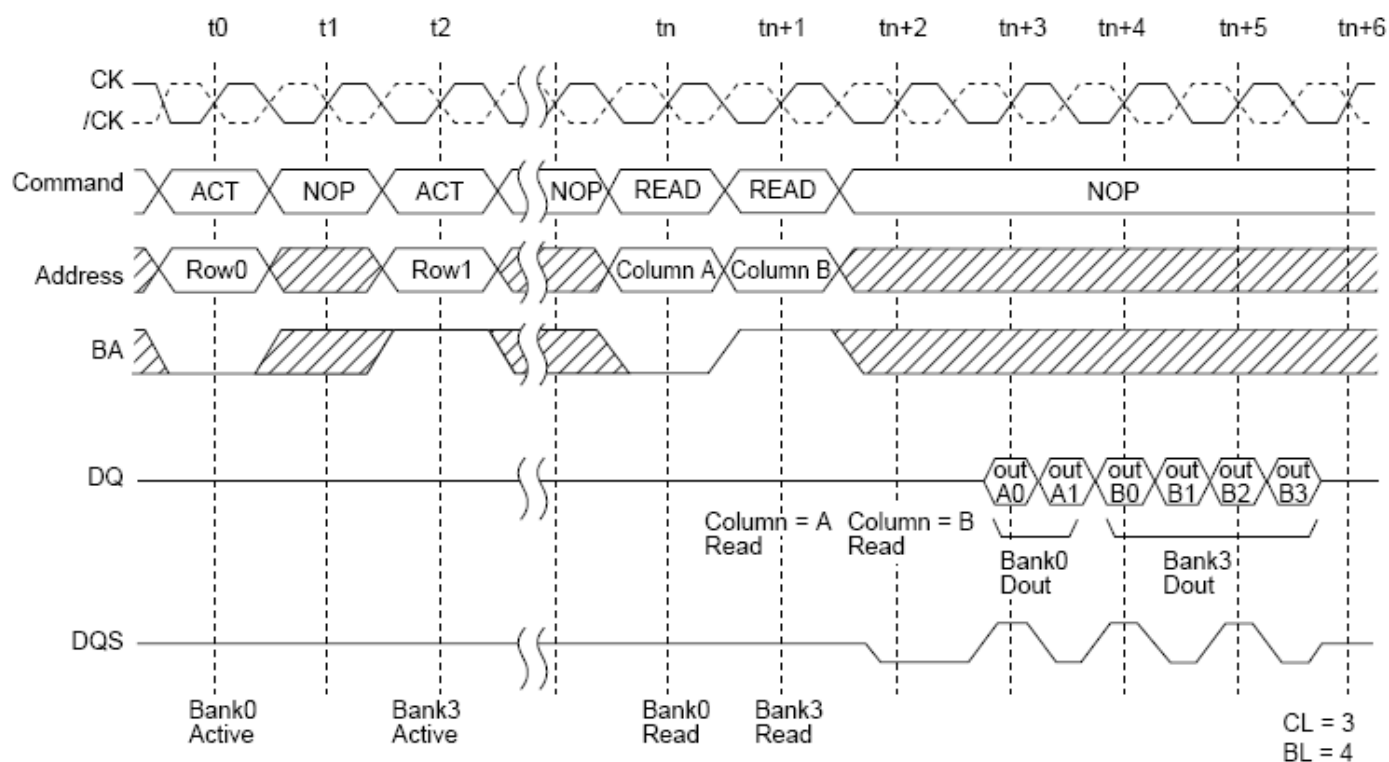

### A Read command to the consecutive Read command interval

Destination row of the consecutive read command

	Bank address	Row Address	Status	Operation
1	Same	Same	ACTIVE	The consecutive read can be performed after an interval of no less than 1 cycle to interrupt the preceding read operation.
2	Same	Different	-	Precharge the bank to interrupt the preceding read operation. $t_{RP}$ after the precharge command, issue the ACT command. $t_{RCD}$ after the ACT command, the consecutive read command can be issued. See 'A read command to the consecutive precharge interval' section.
3	Different	Any	ACTIVE	The consecutive read can be performed after an interval of no less than 1 cycle to interrupt the preceding read operation.
			IDLE	Precharge the bank without interrupting the preceding read operation. $t_{RP}$ after the precharge command, issue the ACT command. $t_{RCD}$ after the ACT command, the consecutive read command can be issued.

Read to Read command interval (same ROW address in the same bank)

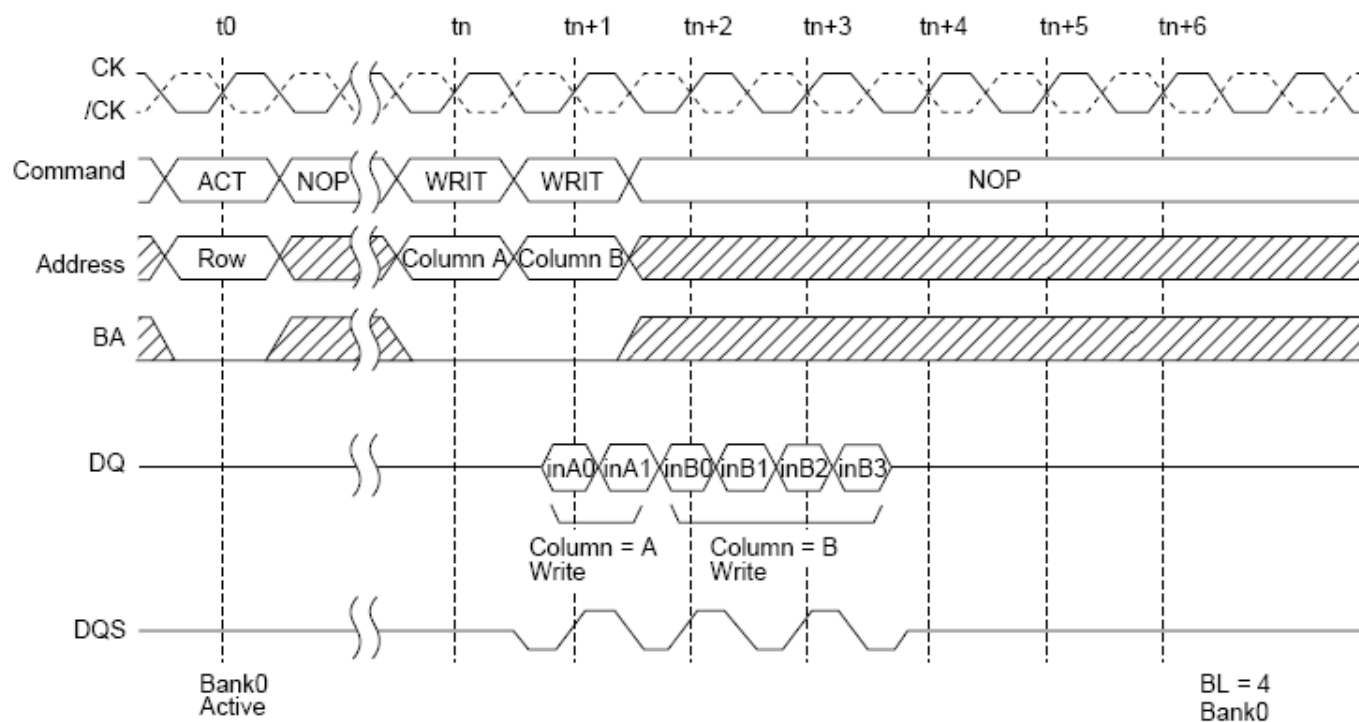

Read to Read command interval (different bank)

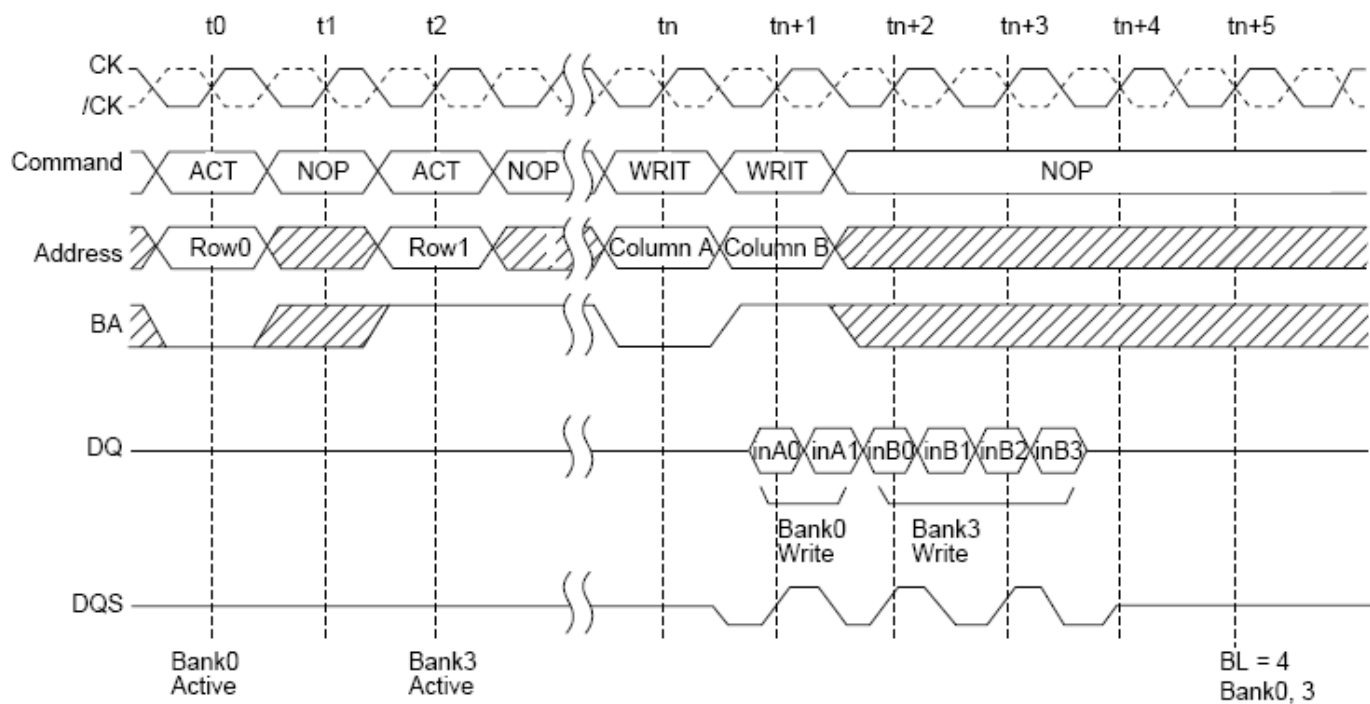

## A Write command to the consecutive Write command interval

Destination row of the consecutive write command

	Bank address	Row Address	Status	Operation
1	Same	Same	ACTIVE	The consecutive write can be performed after an interval of no less than 1 cycle to interrupt the preceding write operation.
2	Same	Different	-	Precharge the bank to interrupt the preceding write operation. $t_{RP}$ after the precharge command, issue the ACT command. $t_{RCD}$ after the ACT command, the consecutive write command can be issued. See 'A write command to the consecutive precharge interval' section.
3	Different	Any	ACTIVE	The consecutive write can be performed after an interval of no less than 1 cycle to interrupt the preceding write operation.
			IDLE	Precharge the bank without interrupting the preceding write operation. $t_{RP}$ after the precharge command, issue the ACT command. $t_{RCD}$ after the ACT command, the consecutive write command can be issued.

Write to Write command interval (same ROW address in the same bank)

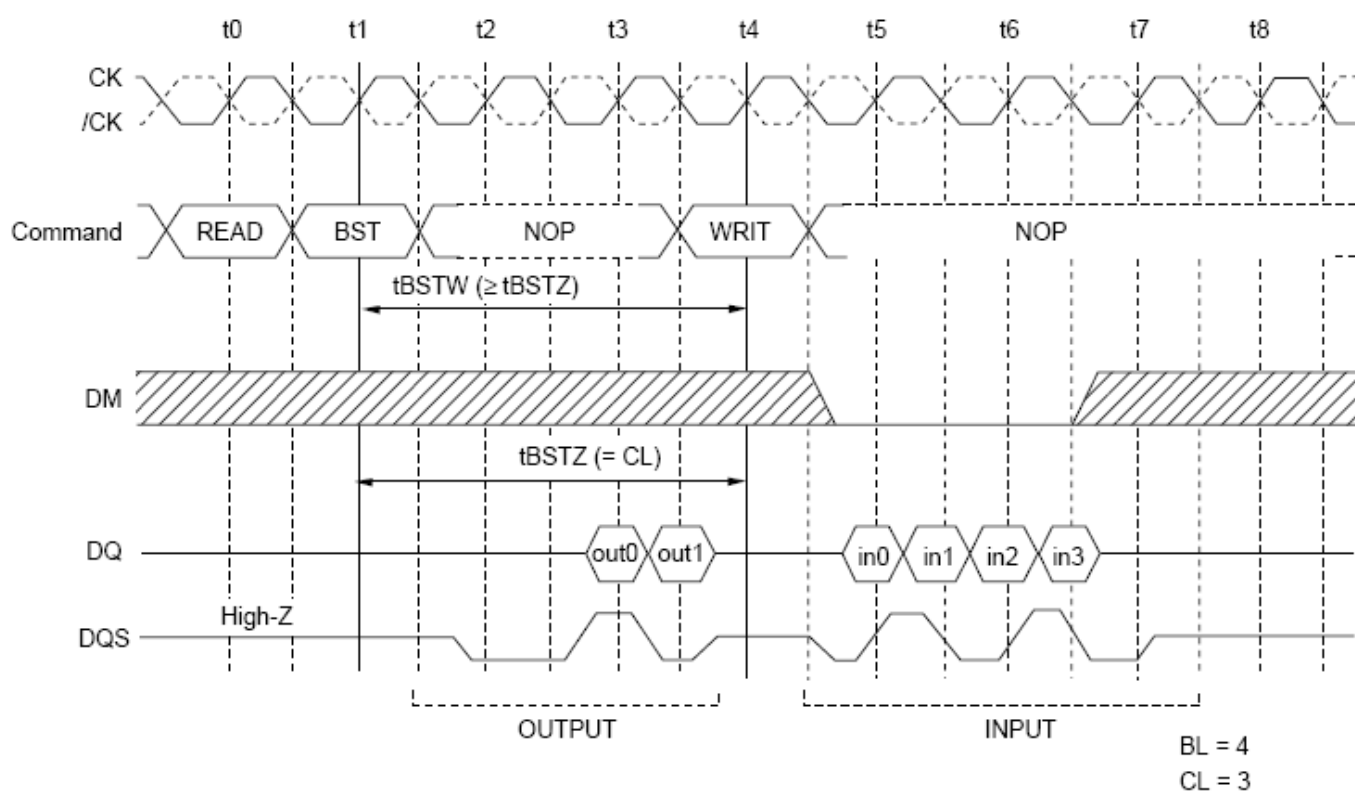

**Write to Write command interval (different bank)**

## A Read command to the consecutive Write command interval with the BST command

Destination row of the consecutive write command

	Bank address	Row Address	Status	Operation
1	Same	Same	ACTIVE	Issue the BST command. $t_{BSTW} (\geq t_{BSTZ})$ after the BST command, the consecutive write command can be issued.
2	Same	Different	-	Precharge the bank to interrupt the preceding read operation. $t_{RP}$ after the precharge command, issue the ACT command. $t_{RCD}$ after the ACT command, the consecutive write command can be issued. See 'A read command to the consecutive precharge interval' section.
3	Different	Any	ACTIVE	Issue the BST command. $t_{BSTW} (\geq t_{BSTZ})$ after the BST command, the consecutive write command can be issued.
			IDLE	Precharge the bank independently of the preceding read operation. $t_{RP}$ after the precharge command, issue the ACT command. $t_{RCD}$ after the ACT command, the consecutive write command can be issued.

Read to Write command interval

## A Write command to the consecutive Read command interval: to complete the burst operation

Destination row of the consecutive read command

	Bank address	Row Address	Status	Operation
1	Same	Same	ACTIVE	To complete the burst operation, the consecutive read command should be performed $t_{WRD}$ after the write command.
2	Same	Different	-	Precharge the bank $t_{WPD}$ after the preceding write command. $t_{RP}$ after the precharge command, issue the ACT command. $t_{RCD}$ after the ACT command, the consecutive read command can be issued. See 'A read command to the consecutive precharge interval' section.
3	Different	Any	ACTIVE	To complete a burst operation, the consecutive read command should be performed $t_{WRD}$ after the write command.
			IDLE	Precharge the bank independently of the preceding write operation. $t_{RP}$ after the precharge command, issue the ACT command. $t_{RCD}$ after the ACT command, the consecutive read command can be issued.

Note:  $t_{WTR}$  is referenced from the first positive CK edge after the last desired data in pair  $t_{WTR}$ .

BL = 4

CL = 3

## Write to Read command interval

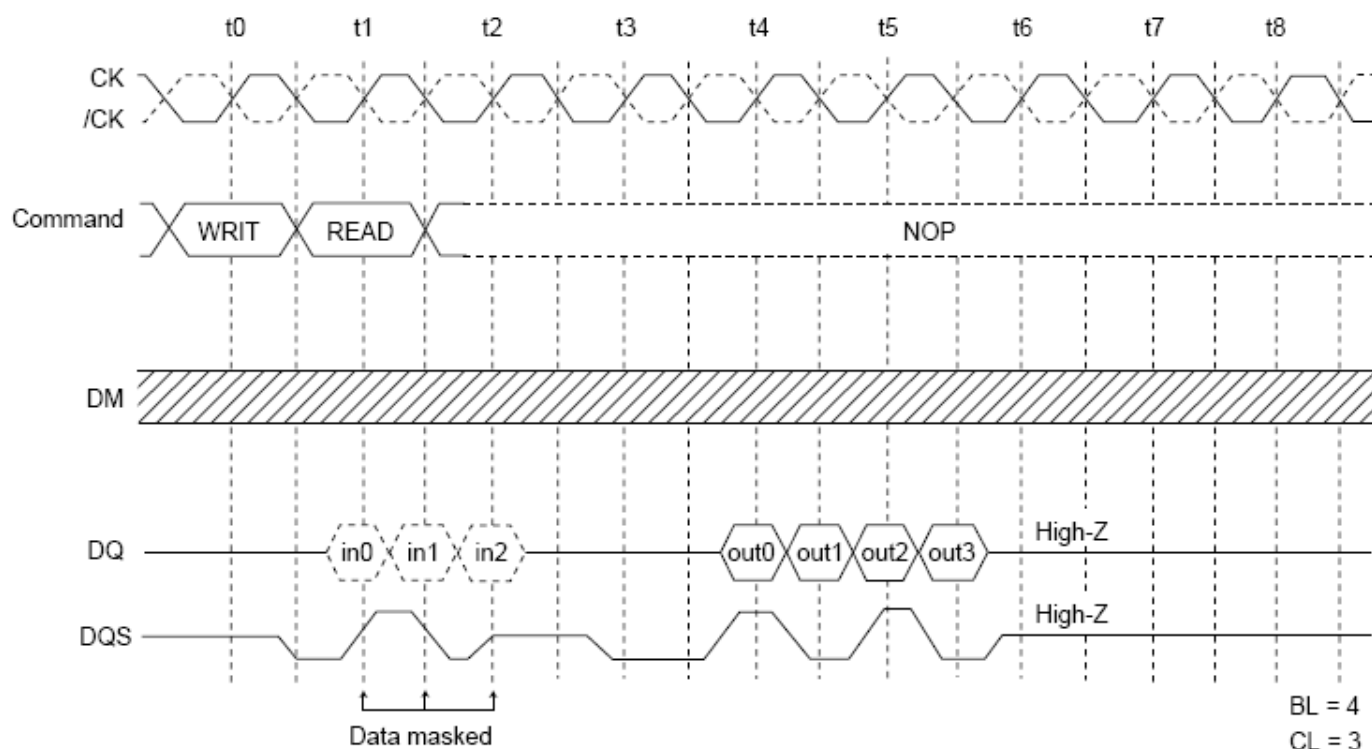

### A Write command to the consecutive Read command interval: to interrupt the write operation

Destination row of the consecutive read command

	Bank address	Row Address	Status	Operation
1	Same	Same	ACTIVE	DM must be input 1 cycle prior to the read command input to prevent from being written invalid data. In case, the read command is input in the next cycle of the write command, DM is not necessary.
2	Same	Different	-	~ <sup>1</sup>
3	Different	Any	ACTIVE	DM must be input 1 cycle prior to the read command input to prevent from being written invalid data. In case, the read command is input in the next cycle of the write command, DM is not necessary.
			IDLE	~ <sup>1</sup>

Note:  
1. Precharge must be preceded to read command. Therefore read command can not interrupt the write operation in this case.

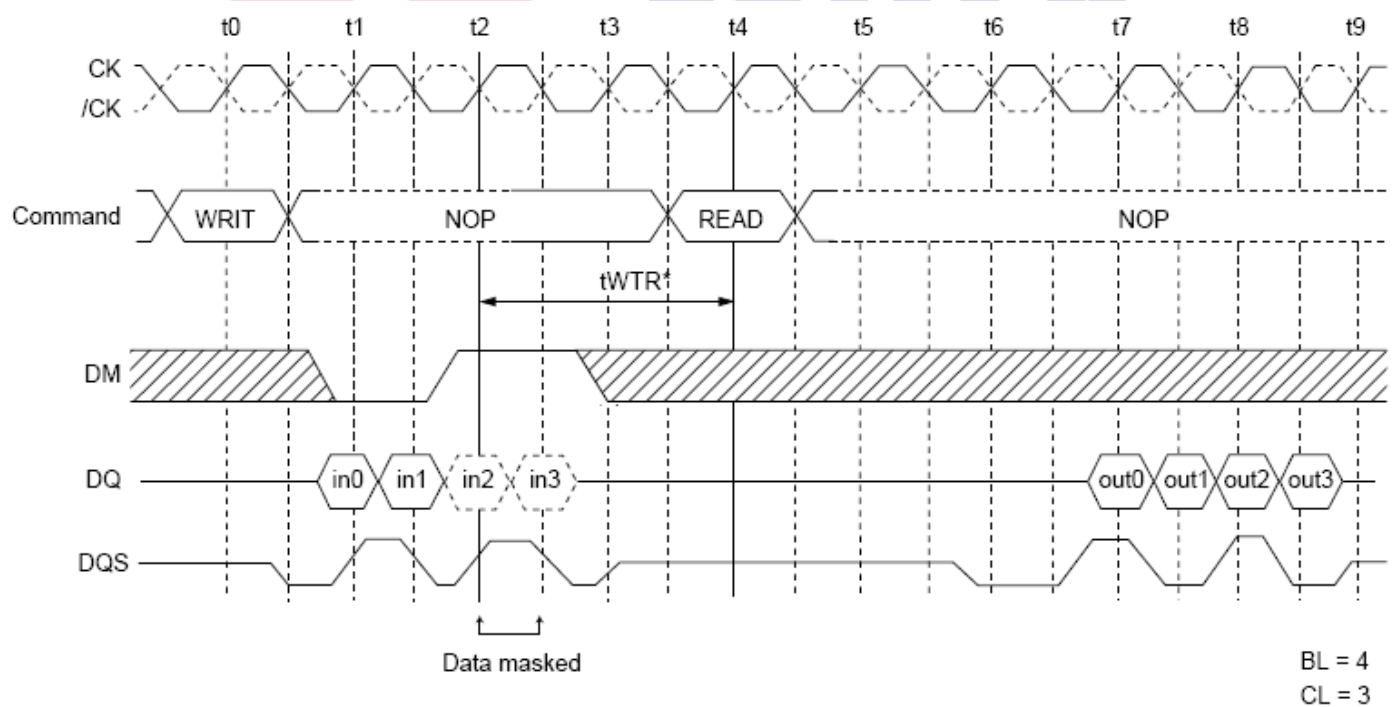

#### Write to Read Command Interval (same bank, same ROW address)

[Write to Read delay = 1 clock cycle]

[Write to Read delay = 2 clock cycle]

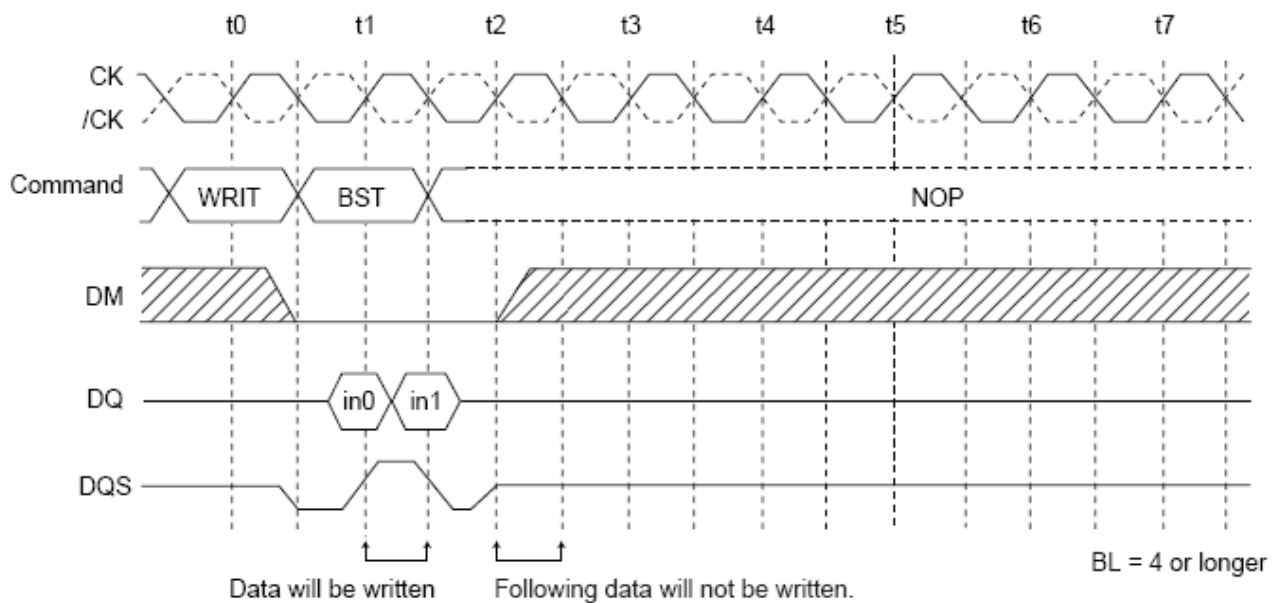

Note:  $t_{WTR}$  is referenced from the first positive CK edge after the last desired data in pair  $t_{WTR}$ .

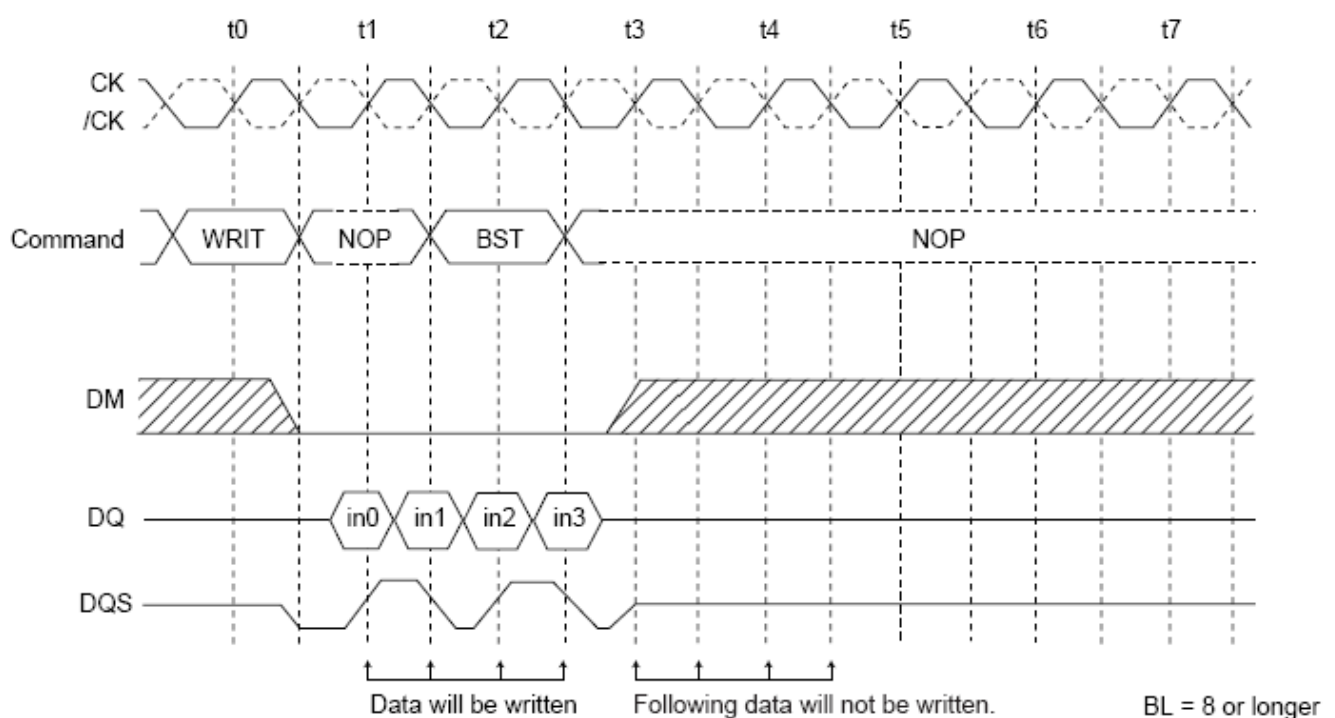

[Write to Read delay = 4 clock cycle]

A Write command to the Bust stop command interval: To interrupt the write operation

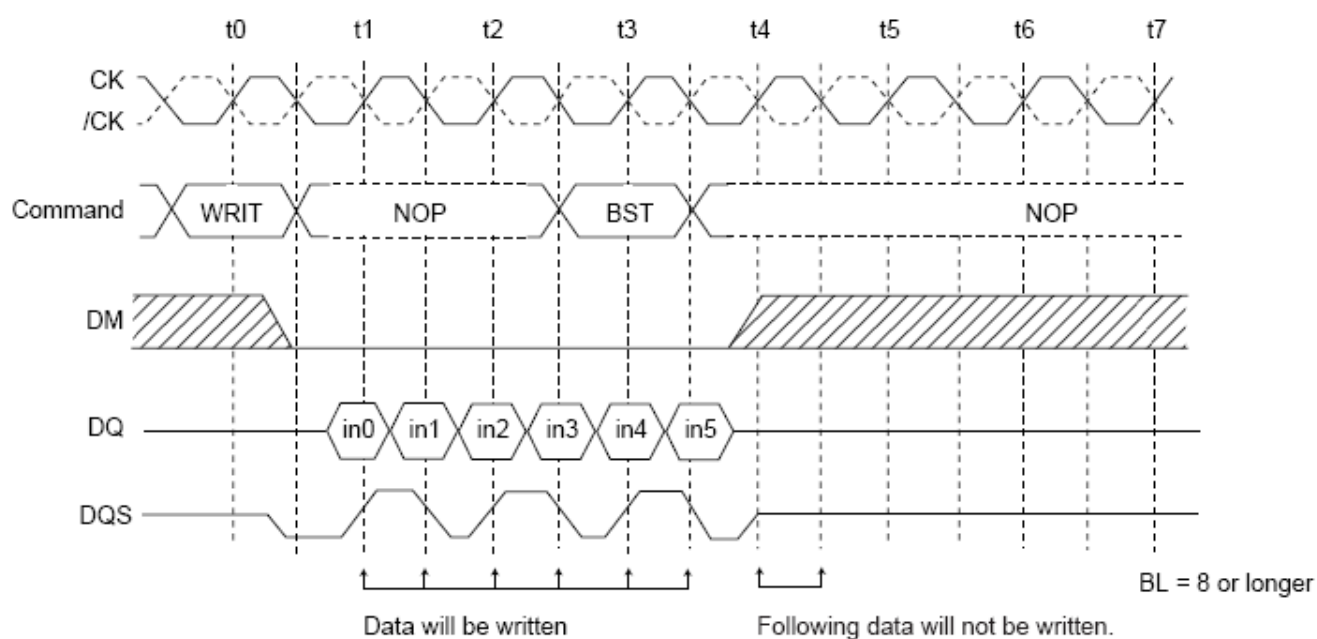

**WRITE to BST Command Interval (Same bank, same ROW address)**

**[Write to BST delay = 1 clock cycle]**

**[Write to BST delay = 2 clock cycle]**

[Write to BST delay = 3 clock cycle]

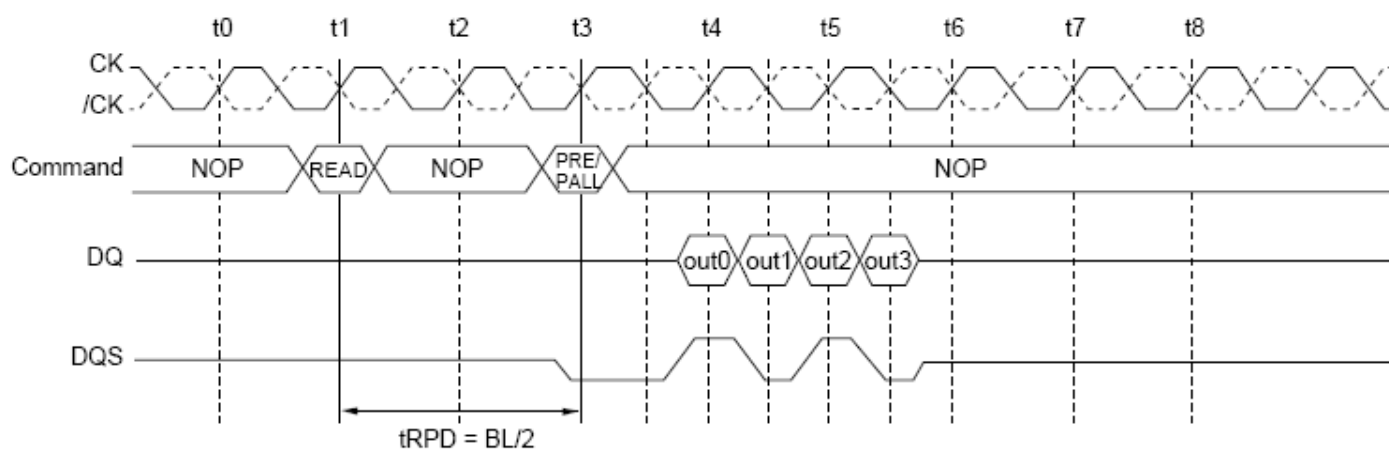

## A Read command to the consecutive Precharge command interval

Operation by each case of destination bank of the consecutive Precharge command.

	Bank address	Operation
1	Same	The PRE and PALL command can interrupt a read operation. To complete a burst read operation, $t_{RPD}$ is required between the read and the precharge command. Please refer to the following timing chart.
2	Different	The PRE command does not interrupt a read command. No interval timing is required between the read and the precharge command.

### READ to PRECHARGE Command Interval (same bank): To output all data

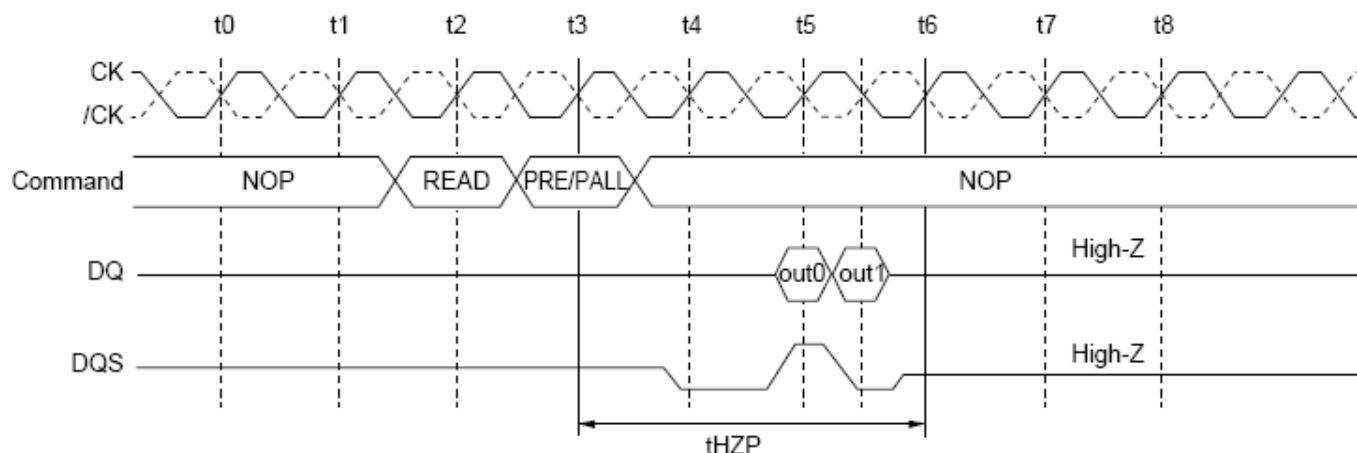

To complete a burst read operation and get a burst length of data, the consecutive precharge command must be issued  $t_{RPD}$  ( $= BL / 2$  cycles) after the read command is issued.

### READ to PRECHARGE Command Interval (same bank): To output all data (CL=3, BL=4)

### READ to PRECHARGE Command Interval (same bank): To stop output data

A burst data output can be interrupted with a precharge command. All DQ pins and DQS pins become high-Z  $t_{HZP}$  ( $= CL$ ) after the precharge command.

### READ to PRECHARGE Command Interval (same bank): To stop output data (CL=3, BL=4, 8)

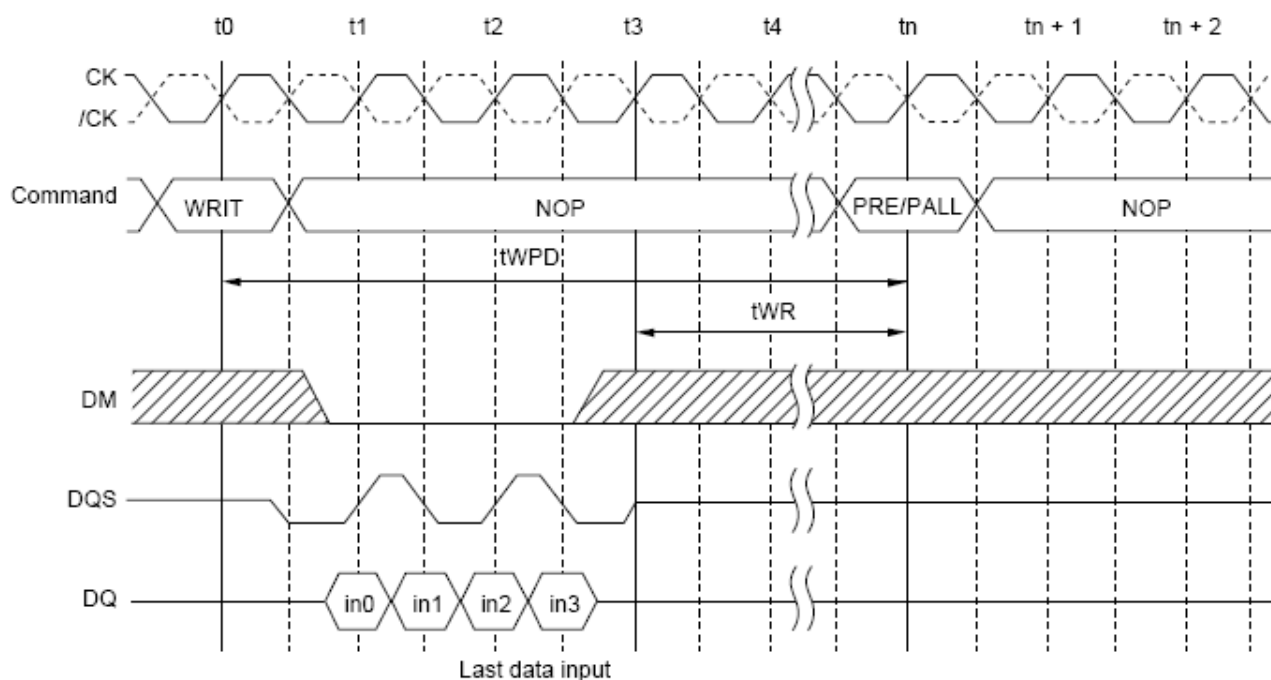

## A Write command to the consecutive Precharge command interval (same bank)

Operation by each case of destination bank of the consecutive Precharge command.

	Bank address	Operation
1	Same	The PRE and PALL command can interrupt a write operation. To complete a burst write operation, $t_{WPD}$ is required between the write and the precharge command. Please refer to the following timing chart.
2	Different	The PRE command does not interrupt a write command. No interval timing is required between the write and the precharge command.

## Write to Precharge command interval (same bank)

The minimum interval  $t_{WPD}$  is necessary between the write command and the precharge command.

Write to Precharge command interval (same bank) (BL=4)

Write to Precharge command interval (same bank) (BL=4, DM to mask data)

### Bank active command interval

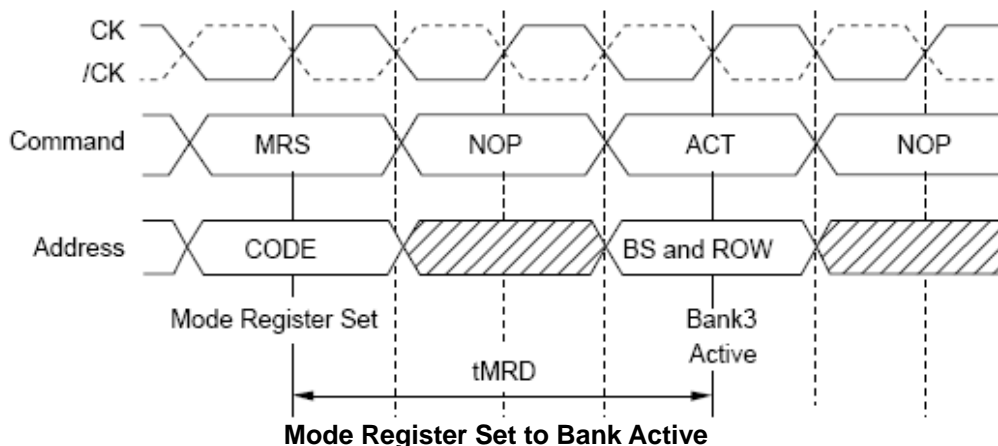

Destination row of the consecutive ACT command

	Bank address	Row Address	Status	Operation
1	Same	Any	ACTIVE	Two successive ACT commands can be issued at $t_{RC}$ interval. In between two successive ACT operations, precharge command should be executed.
2	Different	Any	ACTIVE	Precharge the bank. $t_{RP}$ after the precharge command, the consecutive ACT command can be issued.
			IDLE	$t_{RRD}$ after an ACT command, the next ACT command can be issued.

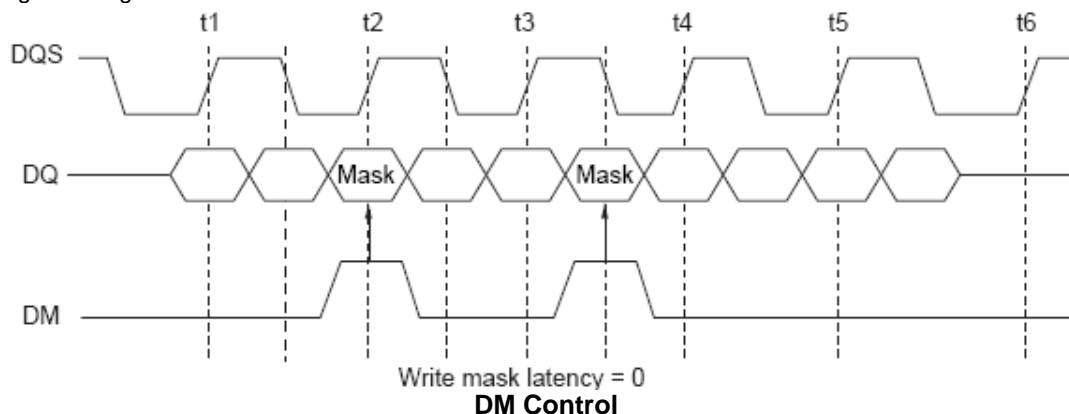

### Mode register set to Bank-active command interval

The interval between setting the mode register and executing a bank-active command must be no less than  $t_{MRD}$ .

### DM Control

DM can mask input data. By setting DM to low, data can be written. UDM and LDM can mask the upper and lower byte of input data, respectively. When DM is set to high, the corresponding data is not written, and the previous data is held. The latency between DM input and enabling/disabling mask function is 0.

No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of MIRA or others.

Any semiconductor devices may have inherently a certain rate of failure. To minimize risks associated with customer's application, adequate design and operating safeguards against injury, damage, or loss from such failure, should be provided by the customer when making application designs.

MIRA's products are not authorized for use in critical applications such as, but not limited to, life support devices or system, where failure or abnormal operation may directly affect human lives or cause physical injury or property damage. If products described here are to be used for such kinds of application, purchaser must do its own quality assurance testing appropriate to such applications.
