P2P2GF4ALF

P2M2GF3ALF

P2P2GF3ALF

Deutron Electronics Corp.

8F, 68, Sec. 3, NanKing E. RD., Taipei 104,
Taiwan, R.O.C.

TEL: (886)-2-2517-7768

FAX: (886)-2-2517-4575

Feature

The 2Gbit DDR3 SDRAM offers the following key features:

- 1.5 V \pm 0.075 V supply voltage for VDD and VDDQ
- Data rate : 1333Mbps/1600Mbps/1866Mbps
- SDRAM configurations with x8 data in/outputs

Page Size: 1 KByte page size

Row address: A0 to A14

Column address: A0 to A9

- SDRAM configurations with x16 data in/outputs

Page Size: 2 KByte page size

Row address: A0 to A13

Column address: A0 to A9

Asynchronous /RESET

- Auto-Precharge operation for read and write commands
- Refresh, Self-Refresh and power saving Power-down modes; Auto Self-refresh (ASR) and Partial array self refresh (PASR)

- Average Refresh Period 7.8 μ s at a TOPER up to 85 °C,

3.9 μ s up to 95 °C

- Operating temperature range:
 - commercial temperature range 0 °C to 95 °C
 - Industrial temperature range -40 °C to 95 °C
- Data mask function for write operation
- Commands can be entered on each positive clock edge
- Data and data mask are referenced to both edges of a differential data strobe pair (double data rate)
- CAS latency (CL): 5, 6, 7, 8, 9, 10, 11, 13
- Posted CAS with programmable additive latency (AL = 0, CL-1 and CL-2) for improved command, address and data bus efficiency
- Read Latency RL = AL + CL
- Programmable CAS Write Latency (CWL) per operating frequency: 5, 6, 7, 8, 9, 10
- Write Latency WL = AL + CWL

- Burst length 8 (BL8) and burst chop 4(BC4) modes: fixed via mode register (MRS) or selectable On-The-Fly (OTF)
- Programmable read burst ordering: interleaved or sequential
- Multi-purpose register (MPR) for readout of non-memory related information
- System level timing calibration support via write leveling and MPR read pattern
- Differential clock inputs (CK and /CK)
- Bi-directional, differential data strobe pair (DQS and /DQS) is transmitted / received with data. Edge aligned with read data and center-aligned with write data
- DLL aligns transmitted read data and strobe pair transition with clock
- Programmable on-die termination (ODT) for data, data mask and differential strobe pairs
- Dynamic ODT mode for improved signal integrity and pre-selectable termination impedances during writes
- ZQ Calibration for output driver and on-die termination using external reference resistor to ground
- Driver strength : RZQ/7, RZQ/6 (RZQ = 240 Ω)
- Lead and halogen free packages:
 - PG-TFBGA-78 for x8 component
 - PG-TFBGA-96 for x16 component

2Gbit x8 x16 DDR3 SDRAM

Burst length on-the-fly bit	A12 /BC	A12 /BC	

1) Page size is the number of bytes of data delivered from the array to the internal sense amplifiers when an ACTIVE command is registered.

Page size is per memory bank and calculated as follows: $\text{Page Size} = 2^{\text{COLBITS}} \times \text{ORG}/8$, where COLBITS is the number of column address bits and ORG is the number of DQ bits for a given SDRAM configuration (×8 or ×16).

Input / Output Signal Functional Description for x8 component

Symbol	Type	Function
CK, /CK	Input	Clock: CK and /CK are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK and negative edge of /CK.
CKE	Input	Clock Enable: CKE High activates, and CKE Low deactivates internal clock signals and device input buffers and output drivers. Taking CKE Low provides Precharge Power-Down and Self-Refresh operation (all banks idle), or Active Power-Down (active row in any bank). CKE is asynchronous for Self-Refresh exit. After V_{REFCA} and V_{REFDQ} have become stable during the power on and initialization sequence, they must be maintained during all operations (including Self-Refresh). CKE must be maintained High throughout read and write accesses. Input buffers, excluding CK, /CK, ODT, CKE and /RESET are disabled during Power-down. Input buffers, excluding CKE and RESET are disabled during self refresh.
/CS	Input	Chip Select: All commands are masked when /CS is registered High. /CS provides for external Rank selection on systems with multiple ranks. /CS is considered part of the command code.
/RAS, /CAS, /WE	Input	Command Inputs: /RAS, /CAS and /WE (along with /CS) define the command being
ODT	Input	On-Die Termination: ODT (registered High) enables termination resistance internal to the DDR3 SDRAM. When enabled, ODT is only applied to each DQ, DQS, /DQS and DM signal for x8 configurations. The ODT signal will be ignored if the Mode Register MR1 is programmed to disable ODT and during Self Refresh.
DM	Input	Input Data Mask : DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH coincident with that input data during a Write access. DM is sampled on both edges of DQS. For x8 device, the function of DM or TDQS/TDQS is enabled by Mode Register
BA0 - BA2	Input	Bank Address Inputs: Define to which bank an Active, Read, Write or Precharge command is being applied. Bank address also determines which mode register is to be accessed during a
A0 - A14	Input	Address Inputs: Provides the row address for Active commands and the column address for Read/Write commands to select one location out of the memory array in the respective bank. (A10/AP and A12 /BC have additional functions, see below). The address inputs also provide the op-code during Mode Register Set commands.

2Gbit x8 x16 DDR3 SDRAM

Symbol	Type	Function
A10 AP	Input	Auto-Precharge: A10 AP is sampled during Read/Write commands to determine whether Auto-Precharge should be performed to the accessed bank after the Read/Write operation. (High: Auto-Precharge, Low: no Auto-Precharge). A10 AP is sampled during Precharge command to determine whether the Precharge applies to one bank (A10 Low) or all banks (A10 High). If only one bank is to be precharged, the bank is selected by bank addresses.
A12 /BC	Input	Burst Chop: A12 /BC is sampled during Read and Write commands to determine if burst chop (on-the-fly) will be performed. (High: no burst chop, Low: burst chopped). See “ Command Truth Table ” on Page 12 for details.
DQ0~7	Input/	Data Input/Output: Bi-directional data bus.
DQS,/DQS	Input/ Output	Data Strobe: Output with read data, input with write data. Edge-aligned with read data, centered in write data. DDR3 SDRAM supports differential data strobe only and does not support single-ended.
/RESET	Input	Active Low Asynchronous Reset: Reset is active when /RESET is Low, and inactive when /RESET is High. /RESET must be High during normal operation. /RESET is a CMOS rail to rail signal with DC High and Low are 80% and 20% of V_{DD} . /RESET active is destructive to data contents.
NC	—	No Connect: no internal electrical connection is present
V_{DDQ}	Supply	DQ Power Supply: 1.5 V \pm 0.075 V
V_{SSQ}	Supply	DQ Ground
V_{DD}	Supply	Power Supply: 1.5 V \pm 0.075 V
V_{SS}	Supply	Ground
V_{REFDQ}	Supply	Reference Voltage for DQ
V_{REFCA}	Supply	Reference Voltage for Command and Address inputs
ZQ	Supply	Reference ball for ZQ calibration

Note: Input only pins (BA0-BA2, A0-A14, /RAS, /CAS, /WE, /CS, CKE, ODT, and /RESET) do not supply termination.

Input / Output Signal Functional Description for x16 component

Symbol	Type	Function
CK, /CK	Input	Clock: CK and /CK are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK and negative edge of /CK.
CKE	Input	Clock Enable: CKE High activates, and CKE Low deactivates internal clock signals and device input buffers and output drivers. Taking CKE Low provides Precharge Power-Down and Self-Refresh operation (all banks idle), or Active Power-Down (active row in any bank). CKE is asynchronous for Self-Refresh exit. After V_{REFCA} and V_{REFDQ} have become stable during the power on and initialization sequence, they must be maintained during all operations (including Self-Refresh). CKE must be maintained High throughout read and write accesses. Input buffers, excluding CK, /CK, ODT, CKE and /RESET are disabled during Power-down. Input buffers, excluding CKE and RESET are disabled during self refresh.
/CS	Input	Chip Select: All commands are masked when /CS is registered High. /CS provides for external Rank selection on systems with multiple ranks. /CS is considered part of the command code.
/RAS, /CAS, /WE	Input	Command Inputs: /RAS, /CAS and /WE (along with /CS) define the command being
ODT	Input	On-Die Termination: ODT (registered High) enables termination resistance internal to the DDR3 SDRAM. When enabled, ODT is only applied to each DQ, DQS, /DQS and DM signal for x8 configurations. The ODT signal will be ignored if the Mode Register MR1 is programmed to disable ODT and during Self Refresh.
DM (DMU), (DML)	Input	Input Data Mask : DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH coincident with that input data during a Write access. DM is sampled on both edges of DQS.
BA0 - BA2	Input	Bank Address Inputs: Define to which bank an Active, Read, Write or Precharge command is being applied. Bank address also determines which mode register is to be accessed during a
A0 - A13	Input	Address Inputs: Provides the row address for Active commands and the column address for Read/Write commands to select one location out of the memory array in the respective bank. (A10/AP and A12 /BC have additional functions, see below). The address inputs also provide the op-code during Mode Register Set commands.

2Gbit x8 x16 DDR3 SDRAM

Symbol	Type	Function
A10 AP	Input	Auto-Precharge: A10 AP is sampled during Read/Write commands to determine whether Auto-Precharge should be performed to the accessed bank after the Read/Write operation. (High: Auto-Precharge, Low: no Auto-Precharge). A10 AP is sampled during Precharge command to determine whether the Precharge applies to one bank (A10 Low) or all banks (A10 High). If only one bank is to be precharged, the bank is selected by bank addresses.
A12 /BC	Input	Burst Chop: A12 /BC is sampled during Read and Write commands to determine if burst chop (on-the-fly) will be performed. (High: no burst chop, Low: burst chopped). See “Command Truth Table” on Page 12 for details.
DQ(DQL0~7),	Input/	Data Input/Output: Bi-directional data bus.
DQSL,/DQSL DQSU, /DQSU	Input/ Output	Data Strobe: Output with read data, input with write data. Edge-aligned with read data, centered in write data. For the x16, DQSL corresponds to the data on DQL0-DQL7; DQSU corresponds to the data on DQU0-DQU7. The data strobe DQSL and DQSU are paired with differential signals /DQSL and /DQSU, respectively, to provide differential pair signaling to the system during reads and writes. DDR3 SDRAM supports differential data strobe only and does not support single-ended.
/RESET	Input	Active Low Asynchronous Reset: Reset is active when /RESET is Low, and inactive when /RESET is High. /RESET must be High during normal operation. /RESET is a CMOS rail to rail signal with DC High and Low are 80% and 20% of V_{DD} , /RESET active is destructive to data contents.
NC	—	No Connect: no internal electrical connection is present
V_{DDQ}	Supply	DQ Power Supply: 1.5 V \pm 0.075 V
V_{SSQ}	Supply	DQ Ground
V_{DD}	Supply	Power Supply: 1.5 V \pm 0.075 V
V_{SS}	Supply	Ground
V_{REFDQ}	Supply	Reference Voltage for DQ
V_{REFCA}	Supply	Reference Voltage for Command and Address inputs
ZQ	Supply	Reference ball for ZQ calibration

Note: Input only pins (BA0-BA2, A0-A13, /RAS, /CAS, /WE, /CS, CKE, ODT, and /RESET) do not supply termination.

Functional Description

Truth Tables

The truth tables list the input signal values at a given clock edge which represent a command or state transition expected to be executed by the DDR3 SDRAM. Command Truth Table lists all valid commands to the DDR3 SDRAM. For a detailed description of the various power mode entries and exits please refer to Clock Enable Truth Table. In addition, the DM functionality is described in Data Mask Truth Table.

Command Truth Table

Function	Abbreviation	CKE		CS	RAS	CAS	WE	BA0 - BA2	A13 - A14	A12 / BC	A10 / AP	A0 - A9,A11	Notes

				H	X	X	X	X	X	X	X	X	
Power Down Exit	PDX	L	H	L	H	H	H	V	V	V	V	V	6,12

Note :

1. All DDR3 SDRAM commands are defined by states of \overline{CS} , \overline{RAS} , \overline{CAS} , WE and CKE at the rising edge of the clock. The MSB of BA, RA, and CA are device density and configuration dependant
2. RESET is Low enable command which will be used only for asynchronous reset so must be maintained HIGH during any function.
3. Bank addresses (BA) determine which bank is to be operated upon. For (E)MRS BA selects an (Extended) Mode Register
4. "V" means "H or L (but a defined logic level)" and "X" means either "defined or undefined (like floating) logic level"
5. Burst reads or writes cannot be terminated or interrupted and Fixed/on the fly BL will be defined by MRS
6. The Power Down Mode does not perform any refresh operations.
7. The state of ODT does not affect the states described in this table. The ODT function is not available during Self Refresh.
8. Self refresh exit is asynchronous.
9. VREF(Both VREFDQ and VREFCA) must be maintained during Self Refresh operation.
10. The No Operation command (NOP) should be used in cases when the DDR3 SDRAM is in an idle or a wait state. The purpose of the No operation command (NOP) is to prevent the DDR3 SDRAM from registering any unwanted commands between operations. A No Operation command will not terminate a previous operation that is still executing, such as a burst read or write cycle.
11. The Deselect command performs the same function as a No Operation command.
12. Refer to the CKE Truth Table for more detail with CKE transition

Clock Enable (CKE) Truth Table for Synchronous Transitions

Current State ¹⁾	CKE(N-1) ²⁾	CKE(N) ²⁾	Command (N) ³⁾ /RAS, /CAS, /WE, /CS	Action (N) ³⁾	Note

Any other state	Refer to “ Command Truth Table ” on Page 10 for more detail with all command signals				4)5)6)7)18)

- 1) Current state is defined as the state of the DDR3 SDRAM immediately prior to clock edge N.
- 2) CKE(N) is the logic state of CKE at clock edge N; CKE (N-1) was the state of CKE at the previous clock edge.
- 3) COMMAND (N) is the command registered at clock edge N, and ACTION (N) is a result of COMMAND (N), ODT is not included here.
- 4) All states and sequences not shown are illegal or reserved unless explicitly described elsewhere in this document.
- 5) The state of ODT does not affect the states described in this table. The ODT function is not available during Self Refresh.
- 6) CKE must be registered with the same value on $t_{CKE,MIN}$ consecutive positive clock edges. CKE must remain at the valid input level the entire time it takes to achieve the $t_{CKE,MIN}$ clocks of registration. Thus, after any CKE transition, CKE may not transition from its valid level during the time period of $t_{IS} + t_{CKE,MIN} + t_{IH}$.
- 7) DES and NOP are defined in “**Command Truth Table**” on Page 10.
- 8) The Power Down does not perform any refresh operations
- 9) X means Don't care (including floating around V_{REFCA}) in Self Refresh and Power Down. It also applies to address pins.
- 10) Valid commands for Power Down Entry and Exit are NOP and DES only
- 11) V_{REF} (both V_{REFCA} and V_{REFDQ}) must be maintained during Self Refresh operation.
- 12) On Self Refresh Exit DES or NOP commands must be issued on every clock edge occurring during the t_{XS} period. Read, or ODT commands may be issued only after t_{XSDLL} is satisfied.
- 13) Valid commands for Self Refresh Exit are NOP and DES only.
- 14) Self Refresh can not be entered while Read or Write operations are in progress.
- 15) If all banks are closed at the conclusion of a read, write or precharge command then Precharge Power-down is entered, otherwise Active Power-down is entered.
- 16) 'Idle state' is defined as all banks are closed (t_{RP} , t_{DAL} , etc. satisfied), no data bursts are in progress, CKE is High, and all timings

2Gbit x8 x16 DDR3 SDRAM

from previous operations are satisfied (t_{MRD} , t_{MOD} , t_{RFC} , $t_{ZQ.INIT}$, $t_{ZQ.OPER}$, t_{ZQCS} , etc.) as well as all Self-Refresh exit and Power-Down

Exit parameters are satisfied (t_{XS} , t_{XP} , t_{XPDLL} , etc.).

17) Self Refresh mode can only be entered from the All Banks Idle state.

18) Must be a legal command as defined in “**Command Truth Table**” on Page 10.

Data Mask (DM) Truth Table

Name (Function)	DM	DQs
Write Enable	L	Valid
Write Inhibit	H	X

2Gbit x8 x16 DDR3 SDRAM

Mode Register 0 (MR0)

The mode register MR0 stores the data for controlling various operating modes of DDR3 SDRAM. It controls burst length, read burst type, CAS latency, test mode, DLL reset, WR (write recovery time for auto-precharge) and DLL control for precharge Power-Down, which includes various vendor specific options to make DDR3 SDRAM useful for various applications. The mode register is written by asserting Low on /CS, /RAS, /CAS, /WE, BA0, BA1, and BA2, while controlling the states of address pins according to **MR0 Mode register definition**

BA2	BA1	BA0	A14	A13	A12	A11	A10	A9	A8	A7	A6	A5	A4	A3	A2	A1	A0

Field	Bits ¹⁾	Description
BL	A[1:0]	Burst Length (BL) and Control Method Number of sequential bits per DQ related to one Read/Write command. 00 _B BL8MRS mode with fixed burst length of 8. A12 /BC at Read or Write command time is Don't care at read or write command time. 01 _B BL0TF on-the-fly (OTF) enabled using A12 /BC at Read or Write command time. When A12 /BC is High during Read or Write command time a burst length of 8 is selected (BL8OTF mode). When A12 /BC is Low, a burst chop of 4 is selected (BC4OTF mode). Auto-Precharge can be enabled or disabled.
RBT	A3	Read Burst Type 0 _B Nibble Sequential
CL	A[6:4,2]	CAS Latency (CL) CAS Latency is the delay, in clock cycles, between the internal Read command and the availability of the first bit of output data. <i>Note: For more information on the supported CL and AL settings based on the operating clock frequency, refer to “Speed Bins” on Page 35.</i> <i>Note: All other bit combinations are reserved.</i> 0000 _B RESERVED 0010 _B 5 0100 _B 6 0110 _B 7 1000 _B 8 1010 _B 9

2Gbit x8 x16 DDR3 SDRAM

Field	Bits ¹⁾	Description
TM	A7	Test Mode <p>The normal operating mode is selected by MR0(bit A7 = 0) and all other bits set to the desired values shown in this table. Programming bit A7 to a 1 places the DDR3 SDRAM into a test mode that is only used by the SDRAM manufacturer and should NOT be used. No operations or functionality is guaranteed if A7 = 1.</p> <p>0_B Normal Mode</p>
DLLres	A8	DLL Reset <p>The internal DLL Reset bit is self-clearing, meaning it returns back to the value of 0 after the DLL reset function has been issued. Once the DLL is enabled, a subsequent DLL Reset should be applied. Any time the DLL reset function is used, t_{DLLK} must be met before any functions that require the DLL can be used (i.e. Read commands or synchronous ODT operations).</p>
WR	A[11:9]	Write Recovery for Auto-Precharge <p>Number of clock cycles for write recovery during Auto-Precharge. WR_{MIN} in clock cycles is calculated by dividing $t_{WR,MIN}$ (in ns) by the actual $t_{CK,AVG}$ (in ns) and rounding up to the next integer: $WR_{MIN} [n_{CK}] = \text{Roundup}(t_{WR,MIN}[\text{ns}] / t_{CK,AVG}[\text{ns}])$. The WR value in the mode register must be programmed to be equal or larger than WR_{MIN}. The resulting WR value is also used with t_{RP} to determine t_{DAL}. Since WR of 9 and 11 is not implemented in DDR3 and the above formula results in these values, higher values have to be programmed.</p> <p>000_B Reserved</p> <p>001_B 5</p> <p>010_B 6</p> <p>011_B 7</p> <p>100_B 8</p> <p>101_B 10</p> <p>110_B 12</p> <p>111_B 14</p>
PPD	A12	Precharge Power-Down DLL Control <p>Active Power-Down will always be with DLL-on. Bit A12 will have no effect in this case. For Precharge Power-Down, bit A12 in MR0 is used to select the DLL usage as shown below.</p> <p>0_B Slow Exit. DLL is frozen during precharge Power-down. Read and synchronous ODT commands are only allowed after t_{XPDLL}.</p> <p>1_B Fast Exit. DLL remains on during precharge Power-down. Any command can be applied after t_{XP}, provided that other timing parameters are satisfied.</p>

1) A13 , A14- even if not available on a specific device - must be programmed to 0

2Gbit x8 x16 DDR3 SDRAM

Mode Register 1 (MR1)

The Mode Register MR1 stores the data for enabling or disabling the DLL, output driver strength, R_{TT_Nom} impedance, additive latency (AL), Write leveling enable and Qoff (output disable). The Mode Register MR1 is written by asserting Low on CS, RAS, CAS, WE, High on BA0 and Low on BA1 and BA2, while controlling the states of address pins according to **MR1 Mode register definition**.

BA2	BA1	BA0	A14	A13	A12	A11	A10	A9	A8	A7	A6	A5	A4	A3	A2	A1	A0
0	0	1	0 ¹⁾	Qoff	0	0	RTT _{nom}	0	Level	RTT _{nom}	DIC		AL		RTT _{nom}	DIC	DLL

MR1 Mode Register Definition (BA[2:0]=001B)

Field	Bits ¹⁾	Description
DLLdis	A0	DLL Disable <p>The DLL must be enabled for normal operation. DLL enable is required during power up initialization, after reset and upon returning to normal operation after having the DLL disabled. During normal operation (DLL-on) with MR1(A0 = 0), the DLL is automatically disabled when entering Self-Refresh operation and is automatically re-enabled and reset upon exit of Self-Refresh operation. Any time the DLL is enabled, a DLL reset must be issued afterwards. Any time the DLL is reset, t_{DLLK} clock cycles must occur before a Read or synchronous ODT command can be issued to allow time for the internal clock to be synchronized with the external clock. Failing to wait for synchronization to occur may result in a violation of the t_{DQSCCK}, t_{AON}, t_{AOF} or t_{ADC} parameters. During t_{DLLK}, CKE must continuously be registered high. DDR3 SDRAM does not require DLL for any Write operation.</p>
DIC	A[5, 1]	Output Driver Impedance Control <p><i>Note: All other bit combinations are reserved.</i></p> <p>00: RZQ/6</p> <p>01_B Nominal Drive Strength RON34 = RQZ/7 (nominal 34.3 Ω, with nominal RZQ = 240 Ω)</p>
R_{TT_NOM}	A[9, 6, 2]	Nominal Termination Resistance of ODT <p>Notes</p> <ol style="list-style-type: none"> If R_{TT_NOM} is used during Writes, only the values $R_{ZQ}/2$, $R_{ZQ}/4$ and $R_{ZQ}/6$ are allowed. In Write leveling Mode (MR1[bit7] = 1) with MR1[bit12] = 1, all R_{TT_Nom} settings are allowed; in Write Leveling Mode (MR1[bit7] = 1) with MR1[bit12] = 0, only R_{TT_NOM} settings of $R_{ZQ}/2$, $R_{ZQ}/4$ and $R_{ZQ}/6$ are allowed. All other bit combinations are reserved. <p>000_B ODT disabled, R_{TT_NOM} = off, Dynamic ODT mode disabled</p> <p>001_B RTT60 = RZQ / 4 (nominal 60 Ω with nominal RZQ = 240 Ω)</p> <p>010_B RTT120 = RZQ / 2 (nominal 120 Ω with nominal RZQ = 240 Ω)</p> <p>011_B RTT40 = RZQ / 6 (nominal 40 Ω with nominal RZQ = 240 Ω)</p>
Field	Bits ¹⁾	Description

2Gbit x8 x16 DDR3 SDRAM

AL	A[4, 3]	Additive Latency (AL) Any read or write command is held for the time of Additive Latency (AL) before it is issued as internal read or write command. Notes 1. AL has a value of CL - 1 or CL - 2 as per the CL value programmed in the MR0 register. 00 _B AL = 0 (AL disabled) 01 _B AL = CL - 1 10 _B AL = CL - 2 11 _B Reserved
Write Leveling enable	A7	Write Leveling Mode 0 _B Write Leveling Mode Disabled, Normal operation mode 1 _B Write Leveling Mode Enabled
TDQS enable	A11	0: Disabled 1: Enabled
Qoff	A12	Output Disable Under normal operation, the SDRAM outputs are enabled during read operation and write leveling for driving data (Qoff bit in the MR1 is set to 0 _B). When the Qoff bit is set to 1 _B , the SDRAM outputs (DQ, DQS, /DQS) will be disabled - also during write leveling. Disabling the SDRAM outputs allows users to run write leveling on multiple ranks and to measure I_{DD} currents during Read operations, without including the output. 0 _B Output buffer enabled 1 _B Output buffer disabled

1) A13 , A14 - even if not available on a specific device - must be programmed to 0_B.

2Gbit x8 x16 DDR3 SDRAM

Mode Register 2 (MR2)

The Mode Register MR2 stores the data for controlling refresh related features, R_{TT_WR} impedance, and CAS write latency. The Mode Register MR2 is written by asserting Low on CS, RAS, CAS, WE, High on BA1 and Low on BA0 and BA2, while controlling the states of address signals according to **MR2 Mode register definition**.

BA2	BA1	BA0	A14	A13	A12	A11	A10	A9	A8	A7	A6	A5	A4	A3	A2	A1	A0 ¹⁾
0	1	0	0 ¹⁾	0	0	Rtt_WR	0	SRT	ASR	CWL						PASR ¹⁾	

MR2 Mode Register Definition (BA[2:0]=010B)

Field	Bits ¹⁾	Description
PASR	A[2:0]	Partial Array Self Refresh (PASR) If PASR (Partial Array Self Refresh) is enabled, data located in areas of the array beyond the specified self refresh location may get lost if self refresh is entered. During non-self-refresh operation, data integrity will be maintained if t_{REFI} conditions are met. 000 _B Full array (Banks 000 _B - 111 _B) 001 _B Half Array (Banks 000 _B - 011 _B) 010 _B Quarter Array (Banks 000 _B - 001 _B) 011 _B 1/8th array (Banks 000 _B) 100 _B 3/4 array (Banks 010 _B - 111 _B) 101 _B Half array (Banks 100 _B - 111 _B) 110 _B Quarter array (Banks 110 _B - 111 _B) 111 _B 1/8th array (Banks 111 _B)
CWL	A[5:3]	CAS Write Latency (CWL) Number of clock cycles from internal write command to first write data in. <i>Note: All other bit combinations are reserved.</i> 000 _B 5 ($3.3 \text{ ns} \geq t_{CK,AVG} \geq 2.5 \text{ ns}$) 001 _B 6 ($2.5 \text{ ns} > t_{CK,AVG} \geq 1.875 \text{ ns}$) 010 _B 7 ($1.875 \text{ ns} > t_{CK,AVG} \geq 1.5 \text{ ns}$) 011 _B 8 ($1.5 \text{ ns} > t_{CK,AVG} \geq 1.25 \text{ ns}$) <i>Note: Besides CWL limitations on $t_{CK,AVG}$, there are also $t_{AA,MIN/MAX}$ restrictions that need to be observed. For details, please refer to Speed Bins.</i>
RFU	A6	0: Manual SR reference (SRT) 1: ASR enable (Optional).

1) A13,A14 - even if not available on a specific device - must be programmed to 0_B.

2Gbit x8 x16 DDR3 SDRAM

Mode Register 3 (MR3)

The Mode Register MR3 controls Multipurpose registers and optional On-die thermal sensor (ODTS) feature. The Mode Register MR3 is written by asserting Low on CS, RAS, CAS, WE, High on BA1 and BA0, and Low on BA2 while controlling the states of address signals according to **MR3 Mode Register Definition**

BA2	BA1	BA0	A14	A13	A12	A11	A10	A9	A8	A7	A6	A5	A4	A3	A2	A1	A0 ¹⁾
0	1	1	0 ¹⁾	0	0	0	0	0	0	0	0	0	0	0	MPR	MPR loc ¹⁾	

MR3 Mode Register Definition (BA[2:0]=011B)

MPR loc	A[1:0]	Multi Purpose Register Location 00 _B Pre-defined data pattern for read synchronization 01 _B RFU 10 _B RFU 11 _B ODTS On-Die Thermal sensor readout (optional)
MPR	A2	Multi Purpose Register Enable <i>Note: When MPR is disabled, MR3 A[1:0] will be ignored.</i> 0 _B MPR disabled, normal memory operation 1 _B Dataflow from the Multi Purpose register MPR

1) A13, A14- even if not available on a specific device - must be programmed to 0_B.

Burst Order

Accesses within a given burst may be interleaved or nibble sequential depending on the programmed bit A3 in the mode register MR0. Regarding read commands, the lower 3 column address bits CA[2:0] at read command time determine the start address for the read burst. Regarding write commands, the burst order is always fixed. For writes with a burst length of 8, the inputs on the lower 3 column address bits CA[2:0] are ignored during the write command. For writes with a burst being chopped to 4, the input on column address 2 (CA[2]) determines if the lower or upper four burst bits are selected. In this case, the inputs on the lower 2 column address bits CA[1:0] are ignored during the write command. The following table shows burst order versus burst start address for reads and writes of bursts of 8 as well as of bursts of 4 operation (burst chop).

Bit Order during Burst

Burst Length	Command	Column Address 2:0			Interleaved Burst Sequence								Nibble Sequential Burst Sequence								Note
					Bit Order within Burst								Bit Order within Burst								
		CA2	CA1	CA0	1.	2.	3.	4.	5.	6.	7.	8.	1.	2.	3.	4.	5.	6.	7.	8.	
8	READ	0	0	0	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	1)
		0	0	1	1	0	3	2	5	4	7	6	1	2	3	0	5	6	7	4	1)
		0	1	0	2	3	0	1	6	7	4	5	2	3	0	1	6	7	4	5	1)
		0	1	1	3	2	1	0	7	6	5	4	3	0	1	2	7	4	5	6	1)

		1	0	1	5	4	7	6	1	0	3	2	5	6	7	4	1	2	3	0	1)
		1	1	0	6	7	4	5	2	3	0	1	6	7	4	5	2	3	0	1	1)
		1	1	1	7	6	5	4	3	2	1	0	7	4	5	6	3	0	1	2	1)
WRITE	V	V	V	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	1)2)	
4 (Burst Chop Mode)	READ	0	0	0	0	1	2	3	T	T	T	T	0	1	2	3	T	T	T	T	1)3)4)
		0	0	1	1	0	3	2	T	T	T	T	1	2	3	0	T	T	T	T	1)3)4)
		0	1	0	2	3	0	1	T	T	T	T	2	3	0	1	T	T	T	T	1)3)4)
		0	1	1	3	2	1	0	T	T	T	T	3	0	1	2	T	T	T	T	1)3)4)
		1	0	0	4	5	6	7	T	T	T	T	4	5	6	7	T	T	T	T	1)3)4)
		1	0	1	5	4	7	6	T	T	T	T	5	6	7	4	T	T	T	T	1)3)4)
		1	1	0	6	7	4	5	T	T	T	T	6	7	4	5	T	T	T	T	1)3)4)
		1	1	1	7	6	5	4	T	T	T	T	7	4	5	6	T	T	T	T	1)3)4)
	WRITE	0	V	V	0	1	2	3	X	X	X	X	0	1	2	3	X	X	X	X	1)2)4)5)
		1	V	V	4	5	6	7	X	X	X	X	4	5	6	7	X	X	X	X	1)2)4)5)

- 1) 0...7 bit number is value of CA[2:0] that causes this bit to be the first read during a burst.
- 2) V: a valid logic level (0 or 1), but respective buffer input ignores level on input pins.
- 3) T: output drivers for data and strobe are in high impedance.
- 4) In case of BC4MRS (burst length being fixed to 4 by MR0 setting), the internal write operation starts two clock cycles earlier than for the BL8 modes. This means that the starting point for t_{WR} and t_{WTR} will be pulled in by two clocks. In case of BC4OTF mode (burst length being selected on-the-fly via A12 | /BC), the internal write operation starts at the same point in time as a burst of 8 write operation. This means that during on-the-fly control, the starting point for t_{WR} and t_{WTR} will not be pulled in by two clocks.
- 5) X: Don't Care

Operating Conditions and Interface Specification

Absolute Maximum Ratings

Parameter	Symbol	Rating		Unit	Note
		Min.	Max.		
Voltage on V_{DD} ball relative to V_{SS}	V_{DD}	-0.4	+1.975	V	1)2)
Voltage on V_{DDQ} ball relative to V_{SS}	V_{DDQ}	-0.4	+1.975	V	1)2)
Voltage on any ball relative to V_{SS}	V_{IN}, V_{OUT}	-0.4	+1.975	V	1)
Storage Temperature	T_{STG}	-55	+100	°C	1)3)

- Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V_{DD} and V_{DDQ} must be within 300mV of each other at all times. V_{REFDQ} and V_{REFCA} must not be greater than 0.6 x V_{DDQ} . When V_{DD} and V_{DDQ} are less than 500 mV, V_{REFDQ} and V_{REFCA} may be equal or less than 300 mV.
- Storage Temperature is the case surface temperature on the center/top side of the SDRAM. For the measurement conditions, please refer to JESD51-2 standard.

Operating Conditions

SDRAM Component Operating Temperature Range

Parameter	Symbol	Rating		Unit	Note
		Min.	Max.		
Normal Operating Temperature Range	T_{OPER}	0	95	°C	1)2)3)
Industrial Operating Temperature Range		-40	95	°C	1)2)3)
Extended Temperature Range		85	95	°C	1)3)4)

- Operating Temperature T_{OPER} is the case surface temperature on the center / top side of the SDRAM. For measurement conditions, please refer to the industry standard document JESD51-2.
- The Normal Temperature Range specifies the temperatures where all SDRAM specification will be supported.
- During operation, the SDRAM operating temperature must be maintained above 0 °C under all operating conditions. Either the device operating temperature rating or the optional ODTS MPR Readout function (See Chapter 2.18, On-Die Thermal Sensor (ODTS)) may be used to set an appropriate refresh rate and/or to monitor the maximum operating temperature. When using the optional ODTS MPR Readout function, the actual device operating temperature may be higher than the T_{OPER} rating that applies for the Normal or Extended Temperature Ranges. For example, T_{CASE} may be above 85 °C when the ODTS indicates that 1X refresh is supported.
- Some application require operation of the DRAM in the Extended Temperature Range between 85 °C and 95 °C operating temperature.
Full specifications are provided in this range, but the following additional conditions apply:
 - Refresh commands have to be doubled in frequency, therefore reducing the Refresh interval t_{REFI} to 3.9 μ s.
 - If Self-Refresh operation is required in the Extended Temperature Range, than it is mandatory to use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = 0B and MR2 A7 = 1B) . For SDRAM operations on DIMM module refer to DIMM module data sheets and SPD bytes for Extended Temperature and Auto Self-Refresh option availability

DC Operating Conditions

Parameter	Symbol	Min.	Typ.	Max.	Unit	Note
Supply Voltage	V_{DD}	1.425	1.5	1.575	V	1)2)
Supply Voltage for Output	V_{DDQ}	1.425	1.5	1.575	V	1)2)
Reference Voltage for DQ, DM inputs	$V_{REFDQ,DC}$	$0.49 \times V_{DD}$	$0.5 \times V_{DD}$	$0.51 \times V_{DD}$	V	3)4)
Reference Voltage for ADD, CMD inputs	$V_{REFCA,DC}$	$0.49 \times V_{DD}$	$0.5 \times V_{DD}$	$0.51 \times V_{DD}$	V	3)4)
External Calibration Resistor connected from ZQ ball to ground	R_{ZQ}	237.6	240.0	242.4	Ω	5)

- 1) V_{DDQ} tracks with V_{DD} . AC parameters are measured with V_{DD} and V_{DDQ} tied together
- 2) Under all conditions V_{DDQ} must be less than or equal to V_{DD} .
- 3) The ac peak noise on V_{REF} may not allow V_{REF} to deviate from $V_{REF,DC}$ by more than $\pm 1\% V_{DD}$ (for reference: approx. ± 15 mV).
- 4) For reference: approx. $V_{DD}/2 \pm 15$ mV.
- 5) The external calibration resistor R_{ZQ} can be time-shared among DRAMs in multi-rank DIMMs.

Input and Output Leakage Currents

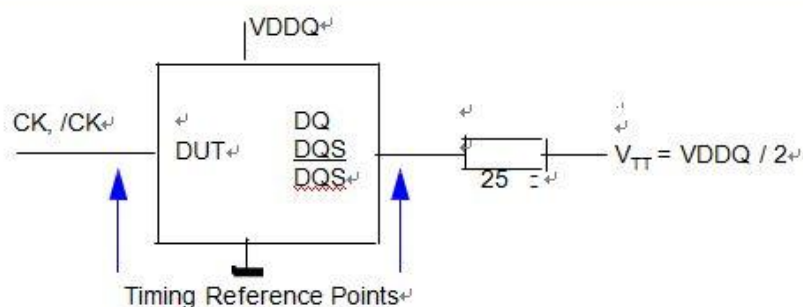

Parameter	Symbol	Condition	Rating		Unit	Note
			Min.	Max.		
Input Leakage Current	I_{IL}	Any input $0 V < V_{IN} < V_{DD}$	-2	+2	μA	1)2)
Output Leakage Current	I_{OL}	$0V < V_{OUT} < V_{DDQ}$	-5	+5	μA	2)3)

- 1) All other pins not under test = 0 V.
- 2) Values are shown per ball.
- 3) DQ's, DQS, /DQS and ODT are disabled.

Interface Test Conditions

Figure 2 represents the effective reference load of 25 Ω used in defining the relevant timing parameters of the device as well as for output slew rate measurements. It is not intended as either a precise representation of the typical system environment nor a depiction of the actual load presented by a production tester. System designers should use IBIS or other simulation tools to correlate the timing reference load to a system environment. Manufacturers correlate to their production test conditions, generally one or more coaxial transmission lines terminated at the tester electronics.

Reference Load for AC Timings and Output Slew Rates

The Timing Reference Points are the idealized input and output nodes / terminals on the outside of the packaged SDRAM device as they would appear in a schematic or an IBIS model. The output timing reference voltage level for single ended signals is the cross point with V_{TT} . The output timing reference voltage level for differential signals is the cross point of the true (e.g. DQS) and the complement (e.g. /DQS) signal.

Voltage Levels

DC and AC Logic Input Levels

Single-Ended Signals

DC and AC Input Levels for Single-Ended Command, Address and Control Signals

Parameter	Symbol	DDR3-1066,1333,1600,		DDR3-1866		Unit	Note
		Min.	Max.	Min.	Max.		
DC input logic high	$V_{IH,CA,DC}$	$V_{REF} + 0.100$	V_{DD}	$V_{REF} + 0.100$	V_{DD}	V	1)
DC input logic low	$V_{IL,CA,DC}$	V_{SS}	$V_{REF} - 0.100$	V_{SS}	$V_{REF} - 0.100$	V	1)

AC input logic low	$V_{IL,CA,AC}$	See ²⁾	$V_{REF} - 0.175$	--	--	V	1)

1) For input only pins except RESET: $V_{REF} = V_{REF,CA}$

2) See **Overshoot and Undershoot Specification**.

DC and AC Input Levels for Single-Ended DQ and DM Signals

Parameter	Symbol	DDR3-1066		DDR3-1333,1600,1866		Unit	Note
		Min.	Max.	Min.	Max.		
DC input logic high	$V_{IH,DQ,DC}$	$V_{REF} + 0.100$	V_{DD}	$V_{REF} + 0.100$	V_{DD}	V	1)
DC input logic low	$V_{IL,DQ,DC}$	V_{SS}	$V_{REF} - 0.100$	V_{SS}	$V_{REF} - 0.100$	V	1)
AC input logic high	$V_{IH,DQ,AC}$	$V_{REF} + 0.175$	See ²⁾	--	--	V	1) 3)
AC input logic low	$V_{IL,DQ,AC}$	See ²⁾	$V_{REF} - 0.175$	--	--	V	1) 3)

1) For DQ and DM: $V_{REF} = V_{REF,DQ}$, for input only signals except RESET: $V_{REF} = V_{REF,CA}$

2) See **Overshoot and Undershoot Specification**.

3) Single ended swing requirement for DQS, /DQS is 350 mV (peak to peak). Differential swing requirement for DQS, /DQS is 700 mV (peak to peak).

2Gbit x8 x16 DDR3 SDRAM

Differential Swing Requirement for Differential Signals

Differential swing requirement for clock (CK - /CK) and strobe (DQS - /DQS)

Parameter	Symbol	DDR3–1066, DDR3–1333, DDR3-1600		Unit	Note
		Min.	Max.		
Differential input high	$V_{IH,DIFF}$	+0.200	See ¹⁾	V	2)
Differential input low	$V_{IL,DIFF}$	See ¹⁾	–0.200	V	2)
Differential input high AC	$V_{IH,DIFF,AC}$	$2 \times (V_{IH,AC} - V_{REF})$ ³⁾	See ¹⁾	V	4)
Differential input low AC	$V_{IL,DIFF,AC}$	See ¹⁾	$2 \times (V_{REF} - V_{IL,AC})$ ⁵⁾	V	4)

- 1) These values are not defined, however they single-ended signals CK, /CK, DQS, /DQS need to be within the respective limits ($V_{IH,DC,MAX}$, $V_{IL,DC,MIN}$) for single-ended signals as well as the limitations for overshoot and undershoot. Refer to Chapter 3.9 .
- 2) Used to define a differential signal slew-rate.
- 3) Clock: use $V_{IH,CA,AC}$ for $V_{IH,AC}$. Strobe: use $V_{IH,DQ,AC}$ for $V_{IH,AC}$.
- 4) For CK - /CK use $V_{IH}/V_{IL,AC}$ of ADD/CMD and VREFCA; for DQS - /DQS use $V_{IH}/V_{IL,AC}$ of DQs and VREFDQ; if a reduced ac-high or ac-low level is used for a signal group, then the reduced level applies also here.
- 5) Clock: use $V_{IL,CA,AC}$ for $V_{IL,AC}$. Strobe: use $V_{IL,DQ,AC}$ for $V_{IL,AC}$.

Allowed Time Before Ringback (t_{DVAC}) for CK - /CK and DQS - /DQS

Slew Rate [V/ns]	t_{DVAC} [ps] @ $ V_{IH/L,DIFF,AC} = 350mV$		t_{DVAC} [ps] @ $ V_{IH/L,DIFF,AC} = 300mV$

Single-Ended Requirements for Differential Signals

Each individual component of a differential signal (CK, DQS, /CK, /DQS,) has also to comply with certain requirements for single-ended signals.

CK and /CK have to approximately reach $V_{SEH,MIN}$ / $V_{SEL,MAX}$ (approximately equal to the ac-levels ($V_{IH,AC}$ / $V_{IL,AC}$) for ADD/CMD signals) in every half-cycle.

DQS, /DQS have to reach $V_{SEH,MIN}$ / $V_{SEL,MAX}$ (approximately the ac-levels ($V_{IH,AC}$ / $V_{IL,AC}$) for DQ signals) in every half-cycle proceeding and following a valid transition.

Note that the applicable ac-levels for ADD/CMD and DQs might be different per speed-bin etc. E.g. if $V_{IH150,AC}$ / $V_{IL150,AC}$ is used for ADD/CMD signals, then these ac-levels apply also for the single-ended signals CK and /CK.

2Gbit x8 x16 DDR3 SDRAM

Note that while ADD/CMD and DQ signal requirements are with respect to V_{ref} , the single-ended components of differential signals have a requirement with respect to $V_{DD}/2$; this is nominally the same. The transition of single-ended signals through the ac-levels is used to measure setup time.

For single-ended components of differential signals the requirement to reach $V_{SEL,MAX}$, $V_{SEH,MIN}$ has no bearing on timing, but adds a restriction on the common mode characteristics of these signals.

Each Single-Ended Levels for CK, DQS, /DQS, /CK

Parameter	Symbol	DDR3-1066, 1333, 1600,1866		Unit	Note
		Min.	Max.		
Single-ended high-level for strobes	V_{SEH}	$V_{IH,AC} - V_{REFDQ} + V_{DDQ}/2$	See ¹⁾	V	2)3)
Single-ended high-level for CK, CK	V_{SEH}	$V_{IH,AC} - V_{REFCA} + V_{DD}/2$	See ¹⁾	V	
Single-ended low-level for strobes	V_{SEL}	See ¹⁾	$V_{IL,AC} + V_{REFDQ} - V_{DDQ}/2$	V	
Single-ended low-level for CK, CK	V_{SEL}	See ¹⁾	$V_{IL,AC} + V_{REFCA} - V_{DD}/2$	V	

1) These values are not defined, however they single-ended signals CK, /CK, DQS, /DQS need to be within the respective limits ($V_{IH,DC,MAX}$, $V_{IL,DC,MIN}$) for single-ended signals as well as the limitations for overshoot and undershoot.

2) For CK, /CK use $V_{IH,AC}$ / $V_{IL,AC}$ of ADD/CMD; for strobes (DQS, /DQS) use $V_{IH,AC}$ / $V_{IL,AC}$ of DQs.

3) $V_{IH,AC}$ / $V_{IL,AC}$ for DQs is based on V_{REFDQ} ; $V_{IH,AC}$ / $V_{IL,AC}$ for ADD/CMD is based on V_{REFCA} ; if a reduced ac-high or ac-low level is used for a signal group, then the reduced level applies also here.

Cross Point Voltage for Differential Input Signals (CK, DQS)

Symbol	Parameter	DDR3-1066, 1333, 1600,1866		Unit	Note
		Min.	Max.		
V_{IX}	Differential Input Cross Point Voltage relative to $V_{DD}/2$ for CK - CK	-150	150	mV	¹⁾
		-175	175	mV	
V_{IX}	Differential Input Cross Point Voltage relative to $V_{DD}/2$ for DQS -DQS	-150	150	mV	

1) Extended range for V_{IX} is only allowed for clock and if single-ended clock input signals CK and /CK are monotonic, have a single-ended swing V_{SEL}/V_{SEH} (see Single-Ended Requirements for Differential Signals) of at least $V_{DD}/2 \pm 250$ mV and if the differential slew rate of CK - /CK is larger than 3 V/ns.

DC and AC Output Measurements Levels

DC and AC Output Levels for Single-Ended Signals

Parameter	Symbol	Value	Unit	Note
DC output high measurement level (for output impedance measurement)	$V_{OH,DC}$	$0.8 \times V_{DDQ}$	V	
DC output mid measurement level (for output impedance measurement)	$V_{OM,DC}$	$0.5 \times V_{DDQ}$	V	
DC output low measurement level (for output impedance measurement)	$V_{OL,DC}$	$0.2 \times V_{DDQ}$	V	

Parameter	Symbol	Value	Unit	Note
AC output high measurement level (for output slew rate)	$V_{OH,AC}$	$V_{TT} + 0.1 \times V_{DDQ}$	V	¹⁾
AC output low measurement level (for output slew rate)	$V_{OL,AC}$	$V_{TT} - 0.1 \times V_{DDQ}$	V	¹⁾

1) Background: the swing of $\pm 0.1 \times V_{DDQ}$ is based on approximately 50% of the static differential output high or low swing with a driver impedance of 40 Ω and an effective test load of 25 Ω to $V_{TT} = V_{DDQ} / 2$.

2Gbit x8 x16 DDR3 SDRAM

AC Output Levels for Differential Signals

Parameter	Symbol	Value		Unit	Note
		Min.	Max.		
AC differential output high measurement level (for output slew rate)	$V_{OH,DIFF.AC}$	$+0.2 \times V_{DDQ}$		V	1)
AC differential output low measurement level (for output slew rate)	$V_{OL,DIFF.AC}$	$-0.2 \times V_{DDQ}$		V	1)
Deviation of the output cross point voltage from the termination voltage	V_{OX}	-100	100	mV	2)

1) Background: the swing of $\pm 0.2 \times V_{DDQ}$ is based on approximately 50% of the static differential output high or low swing with a driver impedance of 40Ω and an effective test load of 25Ω to $V_{TT} = V_{DDQ} / 2$ at each of the differential outputs.

2) With an effective test load of 25Ω to $V_{TT} = V_{DDQ} / 2$ at each of the differential outputs (see Interface Test Conditions).

Output Slew Rates

Parameter	Symbol	DDR3–1066 /–1333 /–1600/–1866		Unit	Note
		Min.	Max.		
Single-ended Output Slew Rate	SRQse	2.5	5	V / ns	1)2)
Differential Output Slew Rate	SRQdiff	5	12	V / ns	

1) For $R_{ON} = R_{ZQ}/7$ settings only.

2) Background for Symbol Nomenclature: SR: Slew Rate; Q: Query Output; se: single-ended; diff: differentia

2Gbit x8 x16 DDR3 SDRAM

ODT DC Impedance and Mid-Level Characteristics

Symbol	Description	V _{OUT} Condition	Min.	Nom.	Max.	Unit	Note
R _{TT120}	R _{TT} effective = 120 Ω	V _{IL,AC} and V _{IH,AC}	0.9	1.0	1.6	R _{ZQ} /2	1)2)3)4)
R _{TT60}	R _{TT} effective = 60 Ω		0.9	1.0	1.6	R _{ZQ} /4	1)2)3)4)
R _{TT40}	R _{TT} effective = 40 Ω		0.9	1.0	1.6	R _{ZQ} /6	1)2)3)4)
R _{TT30}	R _{TT} effective = 30 Ω		0.9	1.0	1.6	R _{ZQ} /8	1)2)3)4)
R _{TT20}	R _{TT} effective = 20 Ω		0.9	1.0	1.6	R _{ZQ} /12	1)2)3)4)
ΔV _M	Deviation of V _M with respect to V _{DDQ} / 2	floating	-5	—	+5	%	1)2)3)4)5)

1) With R_{ZQ} = 240 Ω.

2) Measurement definition for R_{TT} : Apply V_{IH,AC} and V_{IL,AC} to test ball separately, then measure current I (V_{IH,AC}) and I (V_{IL,AC}) respectively.

$$R_{TT} = [V_{IH,AC} - V_{IL,AC}] / [I(V_{IH,AC}) - I(V_{IL,AC})]$$

3) The tolerance limits are specified after calibration with stable voltage and temperature. For the behavior of the tolerance limits if temperature or voltage changes after calibration, see the **ODT DC Impedance Sensitivity on Temperature and Voltage Drifts**.

4) The tolerance limits are specified under the condition that V_{DDQ} = V_{DD} and that V_{SSQ} = V_{SS}.

5) Measurement Definition for ΔV_M: Measure voltage (V_M) at test ball (midpoint) with no load: ΔV_M = (2 × V_M / V_{DDQ} - 1) × 100%.

ODT DC Impedance Sensitivity on Temperature and Voltage Drifts

If temperature and/or voltage change after calibration, the tolerance limits widen for R_{TT} according to the following tables.

The following definitions are used:

$$\Delta T = T - T \text{ (at calibration)}$$

$$\Delta V = V_{DDQ} - V_{DDQ} \text{ (at calibration)}$$

$$V_{DD} = V_{DDQ}$$

Symbol	Value		Unit	Note
	Min.	Max.		
R _{TT}	0.9 - dR _{TT} dT × ΔT - dR _{TT} dV × ΔV	1.6 + dR _{TT} dT × ΔT + dR _{TT} dV × ΔV	R _{ZQ} / TISF _{R_{TT}}	1)

1) TISF_{R_{TT}}: Termination Impedance Scaling Factor for R_{TT}:

$$TISF_{R_{TT}} = 12 \text{ for } R_{TT020}$$

$$TISF_{R_{TT}} = 8 \text{ for } R_{TT030}$$

$$TISF_{R_{TT}} = 6 \text{ for } R_{TT040}$$

$$TISF_{R_{TT}} = 4 \text{ for } R_{TT060}$$

$$TISF_{R_{TT}} = 2 \text{ for } R_{TT120}$$

ODT DC Impedance Sensitivity Parameters

Symbol	Value		Unit	Note
	Min.	Max.		
dR _{TT} dT	0	1.5	%/°C	1)
dR _{TT} dV	0	0.15	%/mV	
Symbol	Value		Unit	Note
	Min.	Max.		
dR _{TT} dT	0	1.5	%/°C	1)
dR _{TT} dV	0	0.15	%/mV	

1) These parameters may not be subject to production test. They are verified by design and characterization.

Interface Capacitance

2Gbit x8 x16 DDR3 SDRAM

Definition and values for interface capacitances are provided in the following table.

Interface Capacitance Values

Parameter	Signals	Symbol	DDR3–1066		DDR3–1333		DDR3–1600		Unit	Note
			Min.	Max.	Min.	Max.	Min.	Max.		
Input/Output Capacitance	DQ, DM, DQS, /DQS	C_{IO}	1.5	3.0	1.5	2.5	1.5	2.3	pF	1)2)3)
Input Capacitance	CK, /CK	C_{CK}	0.8	1.6	0.8	1.4	0.8	1.4	pF	2)3)
Input Capacitance Delta	CK, /CK	C_{DCK}	0	0.15	0	0.15	0	0.15	pF	2)3)4)
Input/Output Capacitance delta DQS and /DQS	DQS, /DQS	C_{DDQS}	0	0.2	0	0.15	0	0.15	pF	2)3)5)
Input Capacitance	All other input-only pins	C_I	0.75	1.5	0.75	1.3	0.75	1.3	pF	2)3)6)
Input Capacitance delta	All CTRL input-only pins	C_{DI_CTRL}	–0.5	0.3	–0.4	0.2	–0.4	0.2	pF	2)3)7)8)
Input Capacitance delta	All ADD and CMD input-only pins	$C_{DI_ADD_CMD}$	–0.5	0.5	–0.4	0.4	–0.4	0.4	pF	2)3)9)10)
Input/Output Capacitance delta	DQ, DM, DQS, /DQS	C_{DIO}	–0.5	0.3	–0.5	0.3	–0.5	0.3	pF	2)3)11)
ZQ Capacitance	ZQ	C_{ZQ}	–	3	–	3	–	3	pF	12)

1) Although the DM signal has different function, the loading matches DQ and DQS

2) This parameter is not subject to production test. It is verified by design and characterization. Capacitance is measured according to JEP147 (Procedure for measuring input capacitance using a vector network analyzer (VNA) with VDD, VDDQ, VSS, VSSQ applied and all other balls floating (except the ball under test, CKE, /RESET and ODT as necessary). VDD = VDDQ = 1.5 V, VBIAS = VDD/2 and on-die termination off

3) This parameter applies to monolithic devices only; stacked/dual-die devices are not covered here

4) Absolute value of CCK - CCK#

5) Absolute value of CIO.DQS - CIO.DQS#

6) CI applies to ODT, /CS, CKE, A[15:0], BA[2:0], /RAS, /CAS, /WE

7) CDI_CTRL applies to ODT, /CS and CKE

8) $CDI_CTRL = CI_CTRL - 0.5 \times (CI_CK + CI_CK\#)$

9) CDI_ADD_CMD applies to A[15:0], BA[2:0], /RAS, /CAS and /WE

10) $CDI_ADD_CMD = CI_ADD_CMD - 0.5 \times (CI_CK + CI_CK\#)$

11) $CDIO = CIO_DQ,DM - 0.5 \times (CIO_DQS + CIO_DQS\#)$

12) Maximum external load capacitance on ZQ signal: 5 pF

Overshoot and Undershoot Specification

AC Overshoot / Undershoot Specification for Address and Control Signals

Parameter	DDR3-1066	DDR3-1333	DDR3-1600	Unit	Note
Maximum peak amplitude allowed for overshoot area	0.4	0.4	0.4	V	1)
Maximum peak amplitude allowed for undershoot area	0.4	0.4	0.4	V	1)
Maximum overshoot area above V_{DD}	0.5	0.4	0.33	$V \times ns$	1)
Maximum undershoot area below V_{SS}	0.5	0.4	0.33	$V \times ns$	1)

1) Applies for the following signals: A[14:0], BA[3:0], /CS, /RAS, /CAS, /WE, CKE and ODT

AC Overshoot / Undershoot Definitions for Address and Control Signals

AC Overshoot / Undershoot Specification for Clock, Data, Strobe and Mask Signals

Parameter	DDR3-1066	DDR3-1333	DDR3-1600	Unit	Note
Maximum peak amplitude allowed for overshoot area	0.4	0.4	0.4	V	1)
Maximum peak amplitude allowed for undershoot area	0.4	0.4	0.4	V	1)
Maximum overshoot area above V_{DDQ}	0.19	0.15	0.13	$V \times ns$	1)
Maximum undershoot area below V_{SSQ}	0.19	0.15	0.13	$V \times ns$	1)

1) Applies for CK, /CK, DQ, DQS, /DQS & DM

AC Overshoot / Undershoot Definitions for Clock, Data, Strobe and Mask Signals

Speed Bins, AC Timing and IDD

The following AC timings are provided with CK and /CK and DQS and /DQS differential slew rate of 2.0 V/ns. Timings are further provided for calibrated OCD drive strength under the “Reference Load for Timing Measurements” according to Interface Test Conditions only. The CK and /CK input reference level (for timing referenced to CK and /CK) is the point at which CK and /CK cross. The DQS and /DQS reference level (for timing referenced to DQS and /DQS) is the point at which DQS and /DQS cross. The output timing reference voltage level is V_{TT} .

Speed Bins

The following tables show DDR3 speed bins and relevant timing parameters. Other timing parameters are provided in the following chapter. For availability and ordering information of products for a specific speed bin, please see Ordering Information. The absolute specification for all speed bins is TOPER and $V_{DD} = V_{DDQ} = 1.5\text{ V} \pm 0.075\text{ V}$. In addition the following general notes apply..

General Notes for Speed Bins:

The CL setting and CWL setting result in tCK.AVG.MIN and tCK.AVG.MAX requirements. When making a selection of tCK.AVG, both need to be fulfilled: Requirements from CL setting as well as requirements from CWL setting

- tCK.AVG.MIN limits: Since CAS Latency is not purely analog - data and strobe output are synchronized by the DLL - all possible intermediate frequencies may not be guaranteed. An application should use the next smaller industry standard tCK.AVG value (2.5, 1.875, 1.5) when calculating $CL[nCK] = tAA[ns] / tCK.AVG[ns]$, rounding up to the next ‘Supported CL’
- tCK.AVG.MAX limits: Calculate $tCK.AVG = tAA.MAX / CLSELECTED$ and round the resulting tCK.AVG down to the next valid speed bin limit (i.e. 3.3 ns or 2.5 ns or 1.875 ns or 1.25 ns). This result is tCK.AVG.MAX corresponding to CLSELECTED ‘Reserved’ settings are not allowed. User must program a different value.

Any DDR3-1066 speed bin also supports functional operation at lower frequencies as shown in the tables which are not subject to Production Tests but verified by Design/Characterization

- Any DDR3-1333 speed bin also supports functional operation at lower frequencies as shown in the tables which are not subject to Production Tests but verified by Design/Characterization
- Any DDR3-1600 speed bin also supports functional operation at lower frequencies as shown in the tables which are not subject to Production Tests but verified by Design/Characterization.

Supported CL setting				6, 7, 8, 9, 10,11,13		nCK	
Supported CWL setting				5, 6, 7, 8, 9		nCK	

NOTE :

2Gbit x8 x16 DDR3 SDRAM

1. The CL setting and CWL setting result in tCK(avg) Min and tCK(avg) Max requirements. When making a selection of tCK(avg), both need to be fulfilled: Requirements from CL setting as well as requirements from CWL setting.
2. tCK(avg) Min limits: Since CAS Latency is not purely analog - data and strobe output are synchronized by the DLL - all possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard tCK(avg) value (2.5, 1.875, 1.5, or 1.25 ns) when calculating CL [nCK] = tAA [ns] / tCK(avg) [ns], rounding up to the next "Supported CL".
3. tCK(avg) Max limits: Calculate tCK(avg) = tAA Max / CL Selected and round the resulting tCK(avg) down to the next valid speed bin (i.e. 3.3ns or 2.5ns or 1.875 ns or 1.25 ns). This result is tCK(avg) Max corresponding to CL selected.
4. "Reserved" settings are not allowed. User must program a different value.
5. Any DDR3-1066 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to production tests but verified by design/characterization.
6. Any DDR3-1333 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to production tests but verified by design/characterization.
7. Any DDR3-1600 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to production tests but verified by design/characterization.
8. Any DDR3-1866 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to production tests but verified by design/characterization.
9. tREFI depends on operating case temperature (T_o).
10. For devices supporting optional downshift to CL=7 and CL=9, tAA/tRCD/tRP min must be 13.125 ns or lower. SPD settings must be programmed to match. For example, DDR3-1333(CL9) devices supporting downshift to DDR3-1066(CL7) should program 13.125 ns in SPD bytes for tAAmin (Byte 16), tRCDmin (Byte 18), and tRPmin (Byte 20). DDR3-1600(CL11) devices supporting downshift to DDR3-1333(CL9) or DDR3-1066(CL7) should program 13.125 ns in SPD bytes for tAAmin (Byte16), tRCDmin (Byte 18), and tRPmin (Byte 20). DDR3-1866(CL13) devices supporting downshift to DDR3-1600(CL11) or DDR3-1333(CL9) or DDR3-1066(CL7) should program 13.125 ns in SPD bytes for tAAmin (Byte16), tRCDmin (Byte 18), and tRPmin (Byte 20). DDR3-1600 devices supporting down binning to DDR3-1333 or DDR3-1066 should program 13.125ns in SPD byte for tAAmin (Byte 16), tRCDmin (Byte 18) and tRPmin (Byte 20). Once tRP (Byte 20) is programmed to 13.125ns, tRCmin (Byte 21,23) also should be programmed accordingly. For example, 49.125ns, (tRASmin + tRPmin = 36ns + 13.125ns) for DDR3-1333 and 48.125ns (tRASmin + tRPmin = 35ns + 13.125ns) for DDR3-1600.
11. For devices supporting optional down binning to CL=11, CL=9 and CL=7, tAA/tRCD/tRPmin must be 13.125ns. SPD setting must be programmed to match. For example, DDR3-1866 devices supporting down binning to DDR3-1600 or DDR3-1333 or 1066 should program 13.125ns in SPD bytes for tAAmin(byte16), tRCDmin(Byte18) and tRP-min (byte20). Once tRP (Byte20) is programmed to 13.125ns, tRCmin (Byte21,23) also should be programmed accordingly. For example, 47.125ns (tRASmin + tRPmin = 34ns +

13.125ns)

Cumulative error across $n = 13, 14, \dots, 49, 50$ cycles	$t_{ERR(nper)}$	$t_{ERR(nper)min} = (1 + 0.68\ln(n)) * t_{JIT(per)min}$ $t_{ERR(nper)max} = (1 + 0.68\ln(n)) * t_{JIT(per)max}$				ps	32

Notes for AC Electrical Characteristics

NOTE :

- Actual value dependent upon measurement level definitions which are TBD.
- Commands requiring a locked DLL are: READ (and READA) and synchronous ODT commands.
- The max values are system dependent.
- WR as programmed in mode register.
- Value must be rounded-up to next higher integer value.
- There is no maximum cycle time limit besides the need to satisfy the refresh interval, t_{REFI} .
- ODT turn on time (min.) is when the device leaves high impedance and ODT resistance begins to turn on. ODT turn on time (max.) is when the ODT resistance is fully on. Both are measured from ODTL_{on}.
- ODT turn-off time (min.) is when the device starts to turn-off ODT resistance. ODT turn-off time (max.) is when the bus is in high impedance. Both are measured from ODT off.

2Gbit x8 x16 DDR3 SDRAM

9. tWR is defined in ns, for calculation of tWRPDEN it is necessary to round up tWR / tCK to the next integer.
10. WR in clock cycles as programmed in MR0.
11. The maximum read postamble is bound by tDQSCK(min) plus tQSH(min) on the left side and tHZ(DQS)max on the right side.
12. Output timing deratings are relative to the SDRAM input clock. When the device is operated with input clock jitter, this parameter needs to be derated by TBD.
13. Value is only valid for RON34.
14. Single ended signal parameter. Refer to the section of tLZ(DQS), tLZ(DQ), tHZ(DQS), tHZ(DQ) Notes for definition and measurement method.
15. tREFI depends on operating case temperature (Tc).
16. tIS(base) and tIH(base) values are for 1V/ns command/address single-ended slew rate and 2V/ns CK, /CK differential slew rate, Note for DQ and DM signals, VREF(DC) = VREFDQ(DC). For input only pins except /RESET, VREF(DC) = VREFCA(DC). See Address / Command Setup, Hold and Derating section.
17. tDS(base) and tDH(base) values are for 1V/ns DQ single-ended slew rate and 2V/ns DQS, /DQS differential slew rate. Note for DQ and DM signals, VREF(DC) = VREFDQ(DC). For input only pins except RESET, VREF(DC) = VREFCA(DC). See Data Setup, Hold and Slew Rate Derating section.
18. Start of internal write transaction is defined as follows ;
For BL8 (fixed by MRS and on-the-fly) : Rising clock edge 4 clock cycles after WL. For BC4 (on-the-fly) : Rising clock edge 4 clock cycles after WL.
For BC4 (fixed by MRS) : Rising clock edge 2 clock cycles after WL.
19. The maximum read preamble is bound by tLZDQS(min) on the left side and tDQSCK(max) on the right side.
20. CKE is allowed to be registered low while operations such as row activation, precharge, autoprecharge or refresh are in progress, but power-down IDD spec will not be applied until finishing those operation.
21. Although CKE is allowed to be registered LOW after a REFRESH command once tREFPDEN(min) is satisfied, there are cases where additional time such as tXPDLL(min) is also required.
22. Defined between end of MPR read burst and MRS which reloads MPR or disables MPR function.
23. One ZQCS command can effectively correct a minimum of 0.5 % (ZQCorrection) of RON and RTT impedance error within 64 nCK for all speed bins assuming the maximum sensitivities specified in the "Output Driver Voltage and Temperature Sensitivity" and "ODT Voltage and Temperature Sensitivity" tables. The appropriate interval between ZQCS commands can be determined from these tables and other application specific parameters.
One method for calculating the interval between ZQCS commands, given the temperature (Tdriftrate) and voltage (Vdriftrate) drift rates that the SDRAM is subject to in the application, is illustrated. The interval could be defined by the following formula:
$$\text{ZQCorrection} = \frac{(\text{TSens} \times \text{Tdriftrate}) + (\text{VSens} \times \text{Vdriftrate})}{\text{TSens} \times \text{Tdriftrate} + \text{VSens} \times \text{Vdriftrate}}$$

where TSens = max(dRTTdT, dRONdTM) and VSens = max(dRTTdV, dRONdVM) define the SDRAM temperature and voltage sensitivities.
24. The tIS(base) AC150 specifications are adjusted from the tIS(base) specification by adding an additional 100 ps of derating to accommodate for the lower alternate threshold of 150 mV and another 25 ps to account for the earlier reference point [(175 mV - 150 mV) / 1 V/ns].
25. Pulse width of a input signal is defined as the width between the first crossing of VREF(DC) and the consecutive crossing of VREF(DC).
26. tDQSL describes the instantaneous differential input low pulse width on DQS - /DQS, as measured from one falling edge to the next consecutive rising edge.
27. tDQSH describes the instantaneous differential input high pulse width on DQS - /DQS, as measured from one rising edge to the next consecutive falling edge.
28. tDQSH,act + tDQSL,act = 1 tCK,act ; with tXYZ,act being the actual measured value of the respective timing parameter in the application.
29. tDSH,act + tDSS,act = 1 tCK,act ; with tXYZ,act being the actual measured value of the respective timing parameter in the application.
30. tCH(abs) is the absolute instantaneous clock high pulse width, as measured from one rising edge to the following falling edge.
31. tCL(abs) is the absolute instantaneous clock low pulse width, as measured from one falling edge to the following rising edge.
32. n = from 13 cycles to 50 cycles. This row defines 38 parameters.
